ID: 142-15-4128

This Report Presented in Partial Fulfillment of the Requirements for the
Degree of Bachelor of Science in Computer Science and Engineering.

Supervised By
Shaon Bhatta Shuvo
Senior Lecturer
Department of CSE
Daffodil International University

Co-Supervised By
Md. Jueal Mia
Lecturer
Department of CSE
Daffodil International University

DAFFODIL INTERNATIONAL UNIVERSITY

DHAKA, BANGLADESH

MONDAY, 26 NOVEMBER 2018.

APPROVAL

This Project titled “**Wrong Parking Solution**”, submitted by Md. Najmul Haque Id. 142-15-3511, Krishno Chandra Roy Id. 121-15-1728 and Md. Imam Mehedi Hasan Id. 142-15-4128 to the Department of Computer Science and Engineering, Daffodil International University, has been accepted as satisfactory for the partial fulfillment of the requirements for the degree of B.Sc. in Computer Science and Engineering (BSc) and approved as to its style and contents. The presentation has been held on 26th November 2018.

BOARD OF EXAMINERS

Dr. Sayed Akhter Hossain
Professor and Head

Department of CSE

DECLARATION

We hereby declare that this project has been done by us under the supervision of **Shaon Bhatta Shuvo, Senior Lecturer, Department of CSE** Daffodil International University. We also declare that neither this project nor any part of this project has been submitted elsewhere for award of any degree or diploma.

ACKNOWLEDGEMENT

First we express our heartiest thanks and gratefulness to almighty God for His divine blessing makes us possible to complete the final year project successfully. We really grateful and wish our profound our indebtedness to **Shaon Bhatta Shuvo, Senior Lecturer**, Department of CSE Daffodil International University, Dhaka.

Deep Knowledge & keen interest of our supervisor in the field of “*Wrong Parking Solution*” to carry out this project. His endless patience ,scholarly guidance ,continual encouragement , constant and energetic supervision, constructive criticism , valuable advice ,reading many inferior draft and correcting them at all stage have made it possible to complete this project.

We would like to express our heartiest gratitude to Traffic Control unit (DMP north Zone), and Head, Department of CSE, for his kind help to finish our project and also to other faculty member and the staff of CSE department of Daffodil International University. We would like to thank our entire course mate in Daffodil International University, who took part in this discuss while completing the course work. Finally, we must acknowledge with due respect the constant support and patients of our parents.

ABSTRACT

The main aim of this project is to develop an Android app which may able to collect complaints with description and photograph of the wrong parking of a city. The module will enhance good Interaction / communication facilities between the Police who controls traffic and BRTA administrator. The app containing pages about a user has to be dynamically created based on the user id and password and information collecting pages. As BRTA has begun its quest for the development or digitalized the traffic controlling of whole city ,”Wrong Parking Solution” app will help to serve in daily life of the city. This system is working for the better management of the wrong parking and will also help people to be aware .This system is working for the better management of wrong parking or managing traffic of a city. For this system it’s not mandatory to have many administrator to maintain it. Traffic Police and Administrator all are satisfy to having a system like this.

CHAPTER 1

Introduction

1.1 Introduction

Wrong Parking Solution for Traffic Police project satisfies the needs of the Traffic Police and the owner of vehicle of a city or a city roads to manage wrong parking for a better purpose. WPS is a combination of systems and processes that connect Traffic Police, vehicle owner with Traffic control authority throw this software. In every city the traffic control corporation has their authority to maintain the traffic problems that citizens face in their daily life. But sometimes it's not possible or doesn't happen that the authority goes in every road or area. So it's difficult for them to know all the problems or wrong parking that's making problem or barrage for clearing the traffic signals in their city area.

1.2 Motivation

WPS can develop a good communication and flexibilities between the Traffic Police, wrong parked vehicle owner and city traffic control authority. Traffic Police can be able to access this app from any location of the city and can also post their cases with photograph, description, and location of the parked area through the internet. For this reason Traffic control authority will be able to achieve citizen's satisfaction by solving those problems.

- In this system a Traffic surgeon can be able to complaints or list cases about the wrong parking they face in their daily duty time.
- Authority (admin) has capable to check and change the current status (if it's solved or not) of their posted cases.
- Users or traffic polices can also view his/her profile , his/her posted or filed cases , and the status of the posted cases if it's solved or not by the authority.
- Admin will add the POLICE ID of the traffic polices of respective area.
- User can register and login only if his/her POLICE ID is in the system given by admin.
- Admin can also change the status of any posts and he/she will able to view the number of posts a user had been posted and the details info of a user.

1.3 Objectives

The objective of Wrong Parking Solution is the development of managing wrong parking cases in a smart and argent way. The main aim of this project is to collect the wrong parking cases with an smart way of a city from traffic controllers and construct an easiest way to solve these cases without harassing. This project will also make a way to easily communicate between the authority and the traffic surgeons and wrong parked vehicle owners. Users are provided the facilities of upholding their problems, listed cases to the concern of the concerned authority. Where the authority is also can concerned about the basic wrong parking situation from root to top of his/ her area by collecting the information and thus the authority can take steps to prevent the wrong parking. Wrong Parking Solution is to maintain effective communication with authorities. The user can able to post his/ her cases in the city with locations, description with photograph. And admin has all the power to control all the things. Created a database system that will be accessed by admin and traffic surgeons can stores their cases to that database.

1.4 Expected Outcome

Being a developing country now, our traffic control system are also going to be developed and digitalized. Traffic Control Unit of DMP (both North & South) is gradually going to developed & digitalized more. So our aim is to create software that helps communication between traffic surgeons and authority easily via Internet. Also it will help vehicle owner to come closer of authority to solve their cases within a short time WPS can be able to solve wrong parking cases within a short time and obviously smartly. And it will also be able to make a strong relationship with traffic surgeons and BRTA authority. Wrong Parking Solution would be able to directly influence the citizens of a city to be aware and responsible about wrong parking. If it done properly and effectively, then the result will be in a number of positive outcomes.

1.5 Report Layout

We describe a process for planning, designing, testing, and deploying an information system. We develop a project which is “Wrong Parking Solution (WPS)”. We have completed our project through time separation of project with the supervision of our respectable project supervisor. In chapter 2 named Introduction we discuss about Motivation, Objectives, and Expected Outcome. In chapter 2 named “Background” we discuss about the related project of Smart Wrong Parking Management System and comparative studies about this project. In Chapter 3 named “Requirement Specification” we discuss about the Business Process Modeling, Requirement Collection and Analysis, Use Case Modeling and Description, Use Case Descriptions, Logical Data Model, Design Requirements. In Chapter 4 named “Design Specification” we discuss about the Front-end Design, Back-end Design, Interaction Design and UX, Implementation Requirements. In Chapter 5 named “Implementation and Testing” we discuss about the Implementation of Database, Implementation of Front-end Design, Implementation of Interactions, Testing Implementation, Test Results and Reports. In Chapter 5 named “Conclusion and Future Scope” we discuss about the Conclusion and Scope for Further Developments. Then Discuss On Appendix.

CHAPTER 2

BACKGROUND

2.1 Introduction

Wrong Parking Solution for Traffic Controllers. It's a mobile application that the traffic surgeons in a city can carry out many problems and wrong parking's. The role of traffic management in a authority is to manage traffics of a area so that they can effectively attend in the development of traffic system of a city. As traffic controllers give a huge effort to control traffic signals. To make their effort more efficient, SWPMS keep records to evaluate their performance and the area of improvement needed to make the traffic system more develop. In some cases, WPS act like a data store as they have to keep the user data, Post Title, Post Images, Description, Location, User POLICE ID and some others report recommended by the authority .Considering the problems on existing process. I am interested to develop e-SWPMS software which will give all the necessary information of a wrong parking within a fraction of minutes. Here users have to input all the necessary information of the case like mentioning what is the Article , simple photograph of that vehicle, putting some description and adding location of the mentioned parking area etc .and users can view the filed case's details information from the software and admin can view it from website at a few time .

2.2 Related Works

Collecting information from traffic surgeons through online and offline and auditing the traffic signal control areas it discovered that they are using a device named "PAUSE MACHINE" to handle wrong parking and other traffic related offence for the last few years . This was an offline process .It's known to us that they faced a lot of problems when handling cases through the machine. The machine has some features like taking photo but they don't have access these option till now. On field we do not find neither any mobile application nor any online application that will help to minimize wrong parking or grow awareness about wrong parking .Traffic Police commissioner of DMP launched "PAUSE MACHINE " to manage traffic offence more easily but BRTA authority doesn't give them to access some feature Even some of offensive driver want to escape from the case on spot by paying the fine but there is no option to pay the fine on spot .Traffic Unit Observe "TRAFFIC WEEK " to aware people .

2.3 Comparative Studies

WPS is online software where authority of Traffic Control will do paperless work by keeping record of complaints with photograph in line. Any concern of the authority can login the software with prior approval as they have to validate themselves by their POLICE ID and can know the details record and current conditions if it was done or not of their posted cases. With the improvement of Information technology sectors, organization can save their time and cost by using WPS .Whatever the company size E-SWPMS is reliable software to get the ultimate output and store huge information data in database by fraction of time . Management will get the error free data in any time by using this Software.

2.4 Scope of the Problem

WPS provide the accurate information about traffic surgeon's complaints to the authority when it needed .We have to know the required information which need to record to submit a complaint or case. If organization wants to view all the posts to select alarming problems to be solved first, which factor needs to consider making a view of all posts? In case of solved cases, how can we distinguish them separately by report? We have to know how they manage their complaint sections, what types of information have to record. In case of solving evaluation, what factor should consider? We need to know the complaints record system and what types of complaints traffic unit expects.

2.5 Challenges

The first challenge is to know about the procedure which is currently using to handle such problems by the organization accurately and collect the necessary data to be automated in software. Adding huge number of POLICE ID is also a challenge for the authority. Proper storage of data that no one can destroy in any way is another challenge. SWPMS uses various types of data, this is a big challenge I have faced to input in software for a complete required report .Validity of data should be assured. The current condition of post should be providing in real time.

CHAPTER 3

REQUIREMENT SPECIFICATION

3.1 Business Process Modeling

Wrong Parking Solution focused on the quality of Software Development for a Business process Model .Business process Modeling (BPM) is a discipline including any combination of modeling, automation execution, control, measurement and optimization of business activity flows in support of enterprise goals, spanning systems employee, customers and partners within and beyond the enterprise boundaries .Data Flow Diagram shows the sequence of events of a business operation. A company must be focused on benefit from software. Smart Complaint Management System business process model is broadcasted and issued in the City Corporation by stingy of the both Android and Web Model. BPM achieved goal is to developed the settlement and accuracy of the specific role and distribute the consumer with an explicit and clear interface definition.

3.2 Requirement Collection and Analysis

3.2.1 Police ID

Admin will add the POLICE ID number of traffic surgeons of the respected area to the database of the system After this data entry, traffic surgeons can register themselves by providing the POLICE ID in the registration requirements.

3.2.2 Posts

Users will be able to make a post or file a case by providing the required information such as title, description photographs of the problems and providing locations that is user-friendly design .

3.2.3 Counting Posts per User

Number of posts or cases from a user will be shown to admin in besides of their user email. And admin can search him with this email from user info section.

3.2.4 View of Posts

This function will show all the list of all posts or cases a user posted or filed, with a current view of action taken against their posts or cases. There's also a posts or cases view in web which is for admin only. Users can also view all the posts or filed cases from their app.

3.2.5 Admin

In this Function only Admin (Authority) can access and view posts or filed cases. At first admin will add POLICE ID no. of the traffic surgeon of his/her respected area. Admin can change the current conditions (status) of cases submitted by the users. This part is in a webpage. Admin can access this from that page. All the data, details of users Number of posts by a unique user will be shown in webpage, made for admin.

3.2.6 New User

In order to use the application a person should have to be registered. A user will be able to register in this system if his or her POLICE ID remains in the database of the system. If anyone is registered under the database, he/she can access the rest process by log in. If they aren't registered, they have to go through registration process and have to be registered first.

3.2.7 User

After a successful registration a traffic surgeon will be called a user of this system. Then they can access the app by log in.

Registration: Users can register themselves if he/she is the part of the following traffic control unit as their POLICE ID number will be stored in the database of the system.

Login: Users can login into the SWPMS system by username and password. If Information is correct then they can Login Successfully.

Logout: Users can logout from the SWPMS system.

Registration failure: If the POLICE ID number of a user doesn't match during registration, it will show an error message.

Login failure: If a user doesn't give correct information and the information is not registered then it will show an error message.

3.3 Use Case Modeling and Description

The use case diagram shows how the users of the system interact with the Software. The user browses the application, and the application has Login option. As a new user they have to register first, and then they can login or access the system. After that the use case of the system shows only the main functionalities of the system. The act or involves is the user. The use cases showing the functionalities are as follows:

- User Registration and Login
- Post a case and view Cases.
- Admin Login.
- Storing POLICE ID of users.
- Changing Status of posts or cases.

Use Case Diagram:

In figure 3.3.1, A user can access the application by login only if he/she is registered before. User can create an ID for login by providing the require information asked in registration page. Then they can post a complaint or file a case by providing the information of required fields. User can view the posts and the current status of posts.

Figure 3.3.1: Use Case Diagram for User in mobile application.

In figure 3.3.2, Admin can Login the web page of the system. He will able to stores the POLICE ID numbers of the traffic surgeons of his/her area. He/she can change the status of posts or filed cases if the complaint or case has been solved and can also view the posts or cases and statuses too. He/she is able to view the count of posts per user and also can view the user info.

Figure3.3.2: Use Case Diagram for user in web

3.4 Logical Data Model

This section describes attributes of database objects and relationship between them with a data table dictionary and tables to overcome confusions. These data objects are made under the consideration. The SCM System consists of three main database groups. First one is storing information about Users POLICE ID, second one stores Complaint's data module and the third one is for storing Users registration data module. In Logical Data Model a system represents data logically, which stored in a Database.

3.5 Design Requirements

Design is the step after requirement and Specification in the development. Once the software requirements have been analyzed and specified the software design involves three technical activities - design, coding, implementation and testing that are required to build and verify the software. The design activities are of main importance in this phase, because, decisions ultimately affecting the success of the software implementation and its ease of maintenance is made. These decisions have the final bearing upon reliability and maintainability of the system. Design is the only way to accurately translate the customer's requirements into finished software or a system. Design is the place where quality is fostered in development. Software design is a process through which requirements are translated into a representation of software. Software design is conducted in two steps. Preliminary design is concerned with the transformation of requirements into data.

- Use case Diagram
- Sequence Diagram
- The ER Diagram
- The State Diagram

3.5.1 The E-R Diagram

The E-R Diagram describes inter-related things of interest in a specific domain. It composed of entity types and specifies relationships that can exist between instances of those entity types. This is E-R diagram for this system.

Figure 3.5.1.1: The E-R Diagram for User in Android Application

Figure 3.5.1.2: The E-R Diagram for User in Web

3.5.2 Sequence Diagram

A Sequence diagram interacts between Admin and user .It is maintaining communication sequence step by step. That is why it is sequence chart. Sequence diagrams are sometimes called event diagrams or event scenarios.

Figure 3.5.2.1: The Sequence Diagram

3.5.3 State Diagram

This is the state diagram for SCMS system.

Figure 3.5.3.1: The State Diagram

CHAPTER 4

DESIGN SPECIFICATION

4.1 Front-end Design

The front-end is everything include with what the user sees, including design and some languages like Android, HTML, CSS, MySQL etc. In Front end Design now a days there have used html, CSS, Html is used for create a simple design of a website and CSS is used for maintaining the layout of Web page. JavaScript is used to client-Side behavior. Web designer designs website. He/she don't need to touch the code. Android is used in Application. Android is a commonly used language to make application. And here Android XML is for UI design in app.

4.2 Back-end Design

Server side is basically representing back-end site. SQL for Structured Query Language is a Relational Database. There are many type of server like as SQL, MYSQL SQL has many versions and it run in Visual Studio Software. SQL works by data update, Delete, Insert etc. Back end development need to create a dynamic Web Site. For android, developer work with android programming language as they need to work with something the database understands. And for website, web developer work with programming languages like PHP, since they need to work with something the database understands. The code they write communicates with the server and then tells the application what to use from the database.

4.3 Interaction Design and UX

Interaction Design is very important part for user experience. It is some useful Model. Mainly Interaction Design means a user Interface Design of an Android app and web page. When that Interface design of android app. or web page is causes user friendly that is basically said UX that means User Experience design. In UX design is used in front end development. It defined how people use an app/site and then make changes through testing by a developer. It ensures user satisfaction by developing the usability and accessibility.

4.4 Implementation Requirements

After end of designing step we started to implement our Software. To implement software at first required an android supported device and front web browser with internet connection, for Front-end design we use Android programming language in App forms and HTML in Web form, since it. We also use CSS language for designing web. We have used Photoshop for clear image processing. For Android we use Android Studio and for HTML and CSS we use Notepad++ software. For Back-end development we use MySQL. Microsoft SQL Server is a Structured Query Language (SQL) based, client/server relational database. These are Software Requirement. For Hardware Requirement we have need an android supported device like Mobile phone and one computer that are connected near of local server. We work in windows 7 operating system.

CHAPTER 5

IMPLEMENTATION AND TESTING

5.1 Implementation of Database

Data storage is a critical component of most information systems. All information systems create, read, update, and delete data. Data can be stored in a file and database. But keeping data in the file has numerous disadvantages. Database design is the process of translating logical data model (ERD in structured design) into physical database schemas. A database schema is the physical model for a database based on the chosen database technology. Database architecture is built on a Database Management System (DBMS). Today Relational Database Management System (RDMS) is used to support the development and reengineering of the overwhelming number of information systems. Relational database stores data on a collection of tables that are related via foreign keys.

In designing database for Object-Oriented Technology Object-Oriented Database System is the first candidate for the database implementation of the objects analyzed. But the Object-Oriented Database is still a new concept and is not commercially used. So the Relational Database is the recommended choice for database implementations of the objects because of the following advantages. In my design performances I have used Relational Database because of its numerous advantages as follows.

- The database is protected from system failure, transaction failure and software failure.
- Multiple users can access the database and can read and write the same database at the same time.
- It provides integrity to the data stored in the database.
- The data in the database are protected against unauthorized read and write operations.

Table 5.1.1: Implementation of Database which will be used to store information for this application.

Table	Action	Rows	Type	Collation	Size	Overhead
☐ NID	★ Browse Structure Search Insert Empty Drop	8	InnoDB	utf8_unicode_ci	16 KiB	-
☐ Problems	★ Browse Structure Search Insert Empty Drop	15	InnoDB	utf8_unicode_ci	16 KiB	-

5.2 Implementation of Front-end Design

Another name of front-end web development is client-side development. Client-side development is a practice of making HTML, CSS and JavaScript for a website or web application and android xml for Android application. So that a user can realize and relate with them quickly. The challenge associated with front end development is that the tools and techniques used to create the front end of a website and an android app change constantly and so the developer needs to constantly be aware of how the field is developing. The objectives of developing an app is to ensure that when the users open up the app they can get the information in a format that is easy to understand and relevant and so far same for the web pages. This is further complicated by the fact that users now use a large variety of devices with varying screen sizes and resolutions thus forcing the designer to take into consideration these aspects when designing an app and a site. They need to ensure that their devices may be various types version and for website, site comes up correctly in different browsers (cross-browser), different operating systems (cross-Platform) and different devices (cross-device), which requires careful planning on the Side of the developed.

Step 1:

- In step 1, figure 5.2.1, Users can register themselves as a user of the app by proper POLICE ID validation.

Figure 5.2.1: Registration Page

Step 2:

- In step 2, figure 5.2.2, Users can login the app.

Figure 5.2.2: Login Page

Step 3:

- In step 3, figure 5.2.3, showing if the user is the authority or public.

Figure 5.2.3: Choosing user option

Step 4:

- In step 4, figure: 5.2.4, Users can post or file a complaint by providing the info that required.

Figure 5.2.4: Submit a case

Step 5:

- In step 5, figure: 5.2.5, Police users can view what they posted and current situation of their posted cases.

Figure 5.2.5: View Cases.

Step 6:

- In step 6, figure: 5.2.6, Public users can view what is the current status of his case by providing case number.

Figure 5.2.6: View Case status.

Step 7:

- In step 7, figure: 5.2.7, Public users can pay the fined amount through the bellow media and get released from his case.

Figure 5.2.7: View payment methods.

Step 8:

- In step 5, figure 5.2.8, Admin of the system will access from web and it's the web view of login.

Figure 5.2.8.: Admin Login from web

Step 9:

- In step 9, figure 5.2.9, Admin will add user POLICE ID number from web in order to check user validity.

Figure 5.2.9: POLICE ID number adding page.

Step 10:

- In step 8, figure 5.2.10, Admin can view user POLICE ID from web.

Figure 5.2.10: POLICE ID number view page.

Step 11:

- In step 9, figure 5.2.11, Admin can view all the filed Cases posted by a user.

Figure 5.2.11: View Cases posted by users.

Step 12:

- In step 12, figure 5.2.12, Admin can change the status of the posted Cases if the problem solved.

Figure 5.2.12: Change status of Cases.

Step 13:

- In step 11, figure 5.2.13, Admin can view the number of posts per user email.

Figure 5.2.13: Count of posts or filed cases per user email.

Step 14:

- In step 12, figure 5.2.14, Admin can view all the registered user info.

Figure 5.1.14: View user info.

5.3 Implementation of Interactions

Most of the creative work for a stage occurs here. Participants work together to gather additional information and refine stage inputs into draft deliverables. Activities of this stage may include interviews, meetings, the generation of prototypes, and electronic correspondence. All of these communications are deemed informal, and are not recorded as minutes, documents of record, controlled software, or official memoranda.

The intent here is to encourage, rather than inhibit the communication process. This process concludes when the majority of participants agree that the work is substantially complete and it is time to generate draft deliverables for formal review and comment.

5.4 Testing Implementation

These tasks are carried out when the systems are either finished or at the Testing stage as to suggest in some of the management methodologies. Testing and evaluation may be done concurrently but are unique from each other in terms of meaning. The two are undertaken in various ways. Prototyping is one of the most commonly used ways and in this particular project one was designed and presented to some of the others. For the way it initially functioned, failures were highlighted in some areas and they were able to be rectified in the final prototype and beside the tools to be used as well were even reconsidered. The prototyping enabled other tests to be done such as the usability test which allowed testing the product on random users. This test aims at four major aspects that is to find Out how accurate Locations are, the relevancy of the content, the presentation layout and its effects and finally the key task rate or how easy were the users able to accomplish the main tasks and in this particular project the main task being able to make a successful error free login with proper authentication.

5.4.1 Test Cases

The test cases are generated to verify if the components used in the GUI form are working accordingly or not. This is a way to ensure that a form is correctly producing its result. A test case is a set of conditions or variables under which a tester will determine whether a system under test satisfies requirement or works correctly. The process of developing test cases can also help find problems in the requirements or design of an application. Some of the sample test cases with screenshots are as follows:

5.4.2 User Registration: Wrong POLICE ID Input

If users give any wrong POLICE ID value during registration then it will be show the same page until he/ she gives a correct POLICE ID value.

The screenshot displays a mobile application interface for 'Wrong Parking Solution'. At the top, a brown header bar contains the app name and a menu icon. Below this, the word 'Register' is prominently displayed. A logo for the app, showing a red car and a 'No Parking' sign, is centered. The registration form consists of four input fields: 'Full Name', 'Email', 'Password', and 'Police ID'. A brown 'SIGN UP' button is positioned at the bottom of the form.

Figure 5.4.2.1: Invalid POLICE ID

5.4.3 User Registration: Success

If users give the right value of POLICE ID which already reserved in the system database can registered them successfully.

Figure 5.4.4.1: Login Error.

5.4.5 User Login: Success

If the admin give right value then entered into the dashboard then Admin Login Successfully

Figure 5.4.5.1: User Login Success.

5.4.6 Unit Tests

A unit test is necessary to check each module of the system is working without bug free or not. This also helps to identify if there is any logical error in the module. All the modules in the system are tested individually during the development process, so this testing has been successfully covered.

5.4.7 Integration Tests

Integration tests are usually accepted to check whether a number of modules are working together appropriately. There are several forms attached to the resources allocation process. It contains 5 forms together and every form is working parallel with one another. In other processes, the scenario is the same case like before.

5.5 Test Results and Reports

The report of a test is required to reflect testing results in a formal way, which gives an opportunity to estimate testing result rapidly. Test result is a document that records data obtained from an evaluation research in an organization manner, define the environment or operating conditions, and indicates the comparison of the test results with objectives. So at the end we can carry out the results as the benefits of usability testing to the end once we have defined the general architecture for interaction objects, the problem is then how to design the set of its instances to make them available to developers of user interfaces. In real world, interaction can found almost everywhere. Interaction is the key to make a system dynamic and attractive to user. It's very necessary to make a system interactive and we also try to. As mentioned in earlier, we also include some unique feature to interact our system.

CHAPTER 6

CONCLUSION AND FUTURE SCOPE

In this part we state about our decision and conclusion. Here we discuss about future scope and how it could have been better.

6.1 Discussion and Conclusion

In conclusion I would like to tell that this Wrong Parking Solution has achieved its purpose. It has taken a huge task for this project to be completed. It has made an easiest operational process for Wrong Parking Solution in a city. Case receiving operations will be smoother and efficient by the use of this software. It has given a huge lift to the traffic control Authority's operations. Whatever that has done manually has been completely shifted to the computerized process and this has enabled the traffic control unit to carry out its operation more quickly. This has also given a wider spectrum of communication to the users. Since whatever that has so far been done manually has been changed to a computerized. It has resulted in more efficient processing of data. The new system has resulted in giving numeric advantages to the traffic control authority in many ways. Some of them are given below State of negligible paper work is almost reduced. Accessing and getting data can be done at a single click. Data manipulation has become simpler and the cost factor has been reduced. It is faster and more efficient processing of data. It is less time consuming. Operations are more transparency. Communications between the users is more efficient.

6.2 Scope for Further Developments

This system has a lot of future scope to make it more users friendly. Some future Scopes are discussed in the below.

The system can perform even better if certain improvements are made:

- In this study, new software was prepared in order to help traffic control authority professional to make their daily work easier and transparent.
- Another main aim of the application is to help establish a better complaint system in traffic control unit.
- The software prepared in the study of both a web based and an android-based application in order to the surgeon and the authority can have the opportunity to communicate through these platforms.
- The system has two main uses, one of which is the administrator of the system, and the other is the user who uses the system.
- Traffic control authority can store their information of complaints and the users can post any related complaint from any place, any time via Internet.
- This application aims to provide higher problem solving efficiency assuring better quality service in shorter servicing cycles.
- I-Phone application can be developed so that it can be accessed globally.
- At present the Users validity process is only POLICE ID validation process. Mobile number validation through sending 4 or 5 digit numbers will be added.
- User Management System will include in order to manage users.
- On the other hand there is no option for uploading videos, it may add in order to get a better result.
- In this system only the valid surgeon can register themselves through POLICE ID. So with this application form people can apply for including their POLICE ID in the system in order to be the user of the system.

Appendix

Appendix A: Project Reflection

In our project a lots of functionality to implement so that system has to be more dynamic and easily maintained all criteria. First of all, at first moment when we are starting to make system that moment we are not expert but after few month latter much more comfortable to work and our supervisor helps us lot. His guidelines help us to implement easily to handle complicated portion. Now we would like to express our experience how implement total work.

- We were facing huge problem how to decide which section actually implement because of nowadays almost all work to implement around surroundings that's why we wanted to different type of problem implement which actually huge people to face that problem
- After that our supervisor had also agree our project proposal then we started to implement our project
- We started our project work about one year ago that's why we get a much more time to implement. It is a good side our university pattern to implement project.
- At first we started complaints management system. It's a most challenging portion in our project. Specially, to adopt the citizen in our system how to use that.
- Then collection of Complaints information likes title, description, image, location and so on.
- Then we decide to expand our project to move the leave side. It's also very important part for Complaint Management system.
- It's really complicated to working Google location API correctly.

Appendix B: Related Diagrams

The purpose of this appendix is to provide an introduction to Related Diagrams (RD) and pointers to some of the foundational references. An influence diagram B is a compact graphical representation of a decision
