## **APPROVAL**

This Project titled Design And Development of an Online Tailoring System submitted by Md. Nazmul Hossain , ID No : 161-15-7400 & Shah Md. Ashab Shahriar, ID No : 161-15-7400 & Sanjida Alam , ID No : 163-15-8375 to the Department of Computer Science and Engineering, Daffodil International University has been accepted as satisfactory for the partial fulfillment of the requirements for the degree of B.Sc. in Computer Science and Engineering and approved as to its style and contents. The presentation has been held on 07/10/2020 .

## **BOARD OF EXAMINERS**

## **Acknowledgment**

First, we express our heartiest thanks and gratefulness to Almighty Allah for His divine blessing makes us possible to complete the final year project successfully.

We really grateful and wish our profound indebtedness to Supervisor **Md. Tarek Habib**, Assistant Professor, Department of CSE Daffodil International University, Dhaka. Deep Knowledge & keen interest of our supervisor in the field of Web Development with Laravel to carry out this project. His endless patience, strong vision, scholarly guidance, constant and energetic supervision, constructive comment about this project, valuable advice, strong efforts and correcting them at all stages have made it possible to complete this project perfectly.

We would like to thank our entire coursemate at Daffodil International University, who took part in this discussion while completing the course work.

Finally, we must acknowledge with due respect the constant support and patience of our parents.

## **ABSTRACT**

Design and Development of an Online Tailoring System is a web-based project with the help of lots of open source plugins, themes, and templates. Moreover, a web-based system is very familiar nowadays. TailorApa helps women to order for their clothes with sizes in a private system. It is a user-friendly UI/UX that helps users to order any cloth. This site is developed by PHP with the Laravel framework. It has a good UI/UX and security system. There are generally two user roles in this site: (1) Admin (2) User. Admin can control the whole system except user orders and product booking. Admin can add/delete/edit/update products and their full information. The user can only use the system for private/custom orders and product booking. So the system is built especially for women for custom tailoring, also in the COVID-19 pandemic.

# CHAPTER 1: INTRODUCTION

## 1.1 Introduction

Design and Development of an Online Tailoring System project where users can book any kind of tailoring cloth and also can sent custom order.It has two panel phases.1.Admin 2.User.Admin can create/delete/edit/update product and can see who are booking this product , their booking information.Admin also can see user's custom order / body / cloth size form user given details.Users can book any product and can send their cloth & body size information to admin. This system is developed by PHP with the help of Laravel framework.Laravel is a popular open-source framework for the development of web applications. The system current version of Laravel is 5.8.33.

## 1.2 Objectives

There are many online sites where user can buy cloths but our strong visionary plan is User can order us for cloths making. User don't need to go outside or tailor shop for size and measurement . Also in Covid-19 panedemic situation it's very harmful for people if they go outside. From our system they don't need to go outside.

- Developing a user-friendly online tailoring website / system in Bangladesh.
- User body measurement / size will be private and data will be secure.
- User can book any cloths/product from system define.
- User can see their cloths status either it's ready or not. Admin will change the status and User can see that notification.

### 1.3 Motivation

This is the new era of Information technology. People are becoming dynamic day by day. Nowadays people much more depending on the online based activities. So building this kind of thing for the people who want to book custom cloths and make cloth from an expert tailor. There are many womens feel hesitate publishing their body size / measurement to a man for making a new cloth and This is also in corona situation womens are in lockdown. For making new cloth they have to go to outside and select their desired cloth and order to tailor for their custom cloth. But on our system / using our system you can save your time and life. The customer won't need to surf for a long time. Our system motivates both womens and lady to find the best product/tailor to make their cloth privately

### 1.4 Expected Outcome

The online tailoring system is very interesting for the womens who are concern about their privacy. Beside custom cloth order you can buy/book cloth from our system. So the expected outcome of this project is:

- System UI/UX will be very user-friendly and light-weight.
- Tailor and User both will get help.
- This site can make a liitle contribution to make vision Digital Bangladesh 2021.
- User can buy and give custom order with privacy ensurement.
- It will help to save time of the people .
- People will make their cloths from their favourite tailor from away by using this platform .

## CHAPTER 2: BACKGROUND ANALYSIS

### 2.1 Introduction

We have seen websites with different vendors with different offers. But we haven't found any website which shows product choose and the same custom order for that product in system. Our site makes a relation between buyers and users to find the best product in their respective choice and place.

### 2.2 Related Work

There are few websites available in Bangladesh like zotno, tailorbd. These websites show only they can give it to tailor nothing else. But in our system they can choose any (from our system or out of our system) product / cloths. After choosing any cloth/dress they can provide their body size privately, securely without any privacy concern. But others competitor system are manual. They have no privacy concern option. \

Also after buy any product or give custom order user have to call those system to know about their product recent situation but in our situation you don't have to call. You can see your product steps/situation from your dashboard. Just login. We made it , keep it simple for all respective user.

## 2.2.1 Zotno

This website agent will pick your dress and then made your dress. And there was no time period graph for the product and change request size of your. No status for customers so people don't know about the deadline of the product. No auto pickup solution from system.

**Figure 2.1.1: Screen Shot of Zotno interface**

### 2.2.1.1 Analysis of Zotno

To get the any product choosing are not here. But from our system you can input all type of information from our system no need to go semi automated system.

To get the dress customer has to search for the specific product in our product vendor system. Customers can get the desired product/dress from our vendors system and give size at a time.

## 2.2.2 Dorjie

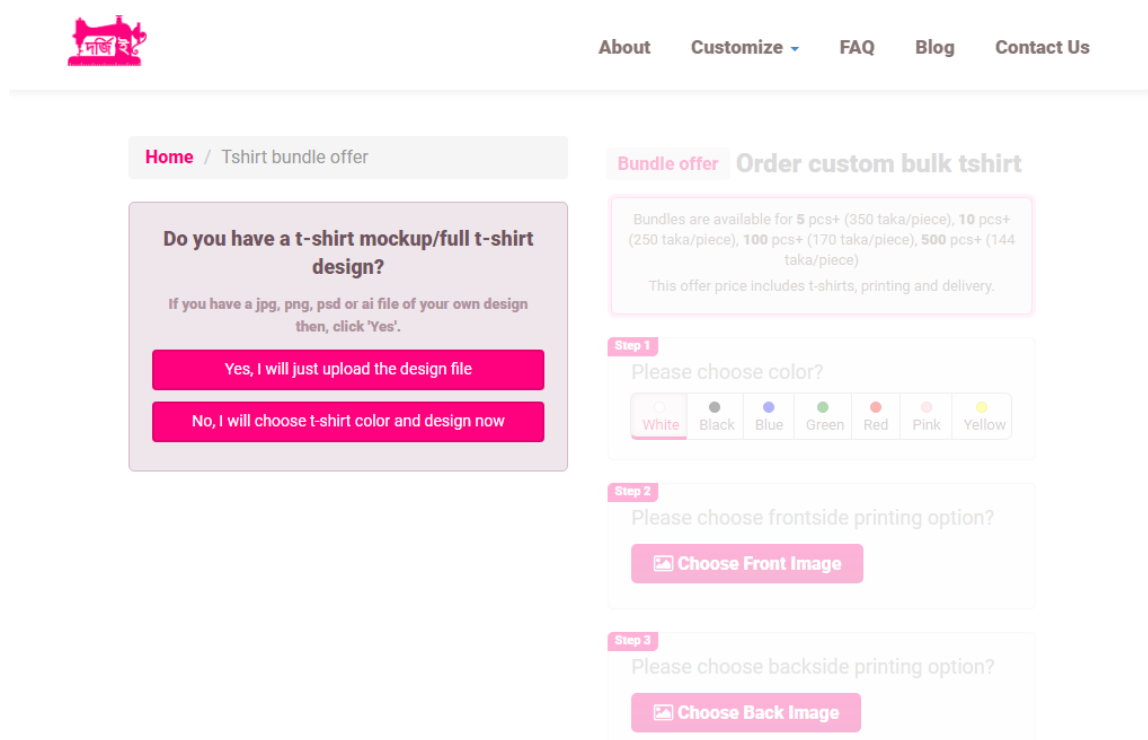

Fig: Dorjie Website

Dorjie is an online based tailoring site. This startup is helped by Grameenphone and Bangladesh Startup Club.

### 2.2.2.1 Analysis of Dorjie

Dorjie is also a online tailoring shop but there problem is they can accept few type or layers of dress. Otherwise they can't accept dress order. But in our site web can make sure that we can make various kind of product for our women.

The user friendly good looking UI/UX layer help to our customer buy regularly and more relaxly. Dorji they accept only if you sent the type of your dress but in our system you can buy pre-made dress from us. Dorjie website didn't write anywhere in there website the minimum price of their product but we write that for our customer.

## 2.3 CHALLENGES

There are so many challenges in this project because we had worked with many stack and different platforms. Also, we are non-professional members of the project group. Our challenges are

- We were only 03(three) members in this project. Both of us don't have the high programming skill about Framework development.
- ACL ( Account Control List ) & middleware for this 03 panel created troubleshoot for this application.
- Independent login route create also was a challenge.
- Managing the code base for our team-mate was a big issue. But we use github for our code collaboration.
- Our project have bug and that's why this is not working properly everytime. We were a little tensed but we took the challenge
- We worked on this project with PHP – Laravel, Javascript, My SQL, Bootstrap, CSS, HTML5, Composer package-manager and Laravel for framework.
- The deadline for the project was also a factor.
- We didn't have enough resources for this project on internet.
- The site does not ensure 100% realtime work.

# CHAPTER 3: REQUIREMENT SPECIFICATION

## 3.1 REQUIREMENT ANALYSIS FOR MY OFFER BD

From the background analysis, we knew the requirement of TailorApa. In this system, we have two panel / admin dashboard .1.Admin 2.Users.

Admin can control the whole site. Admin can add admin, user, product, receive custom order and log-reader to see any bug ongoing on our whole system.

### 3.2.1 USE CASE MODELING

Use case refers to the activity of the admin of TailorApa. The admin can control the whole system except custom order of user.

**Figure:3.2.1:use-case Diagram**

## CHAPTER 4: SYSTEM DESIGN AND IMPLEMENTATION

### 4.1 Development Methodology

Our proposed online website TailorApacovered all sorts ofproducts choosing and custom order of your dress and dress/body size.This site can use any sort of user.Such as  
1.Admin 2.User.

When an admin logged in the system he/she can take access to the whole system.Users/ Customers can access products and custom Order.

In the front-end, it has a navigation bar where to exist home button,category option,area and login,registration option.In the back-end, it is used the database to store all system data.

In any software development, there are some rules to follow. In this development, methodology indicates that. First of all, we have to analyze the problem. Then make the design to create the software. At next we have to code and test the software if there is no bug we found we have to formalize the solution and maintain the program.

From admin dashboard admin can add per product making cost and this information will sent to the all user dashboard. User can see the information and can take a decision.

The Front-end part and backend part are scaffolding with Laravel blade templating engine. This awesome feature come from Laravel and that's why we can easily intregate the frontend file with backend.

## 4.2 Website Design

For any kind of website their, some tools and language exist. Basically, HTML, CSS, Bootstrap Framework, jQuery is use for structural design of a website/system. For designing this website we also use some tools and frameworks like that. Obviously our

Backend code for framework was PHP.

### 4.2.1 Front-End Design

- HTML
- CSS
- Javascript
- Bootstrap
- JQuery

### 4.2.2 Back-End Design

- Laravel
- PHP
- Javascript
- Bootstrap
- Apache ( For Local Server )

### 4.2.3 Database Design

- PHPMysqlAdmin

- My SQL

## **Git& Co-Working Solution**

- Github
- Github Issue Tracker
- Github Action
- Github Deployment
- Github Project

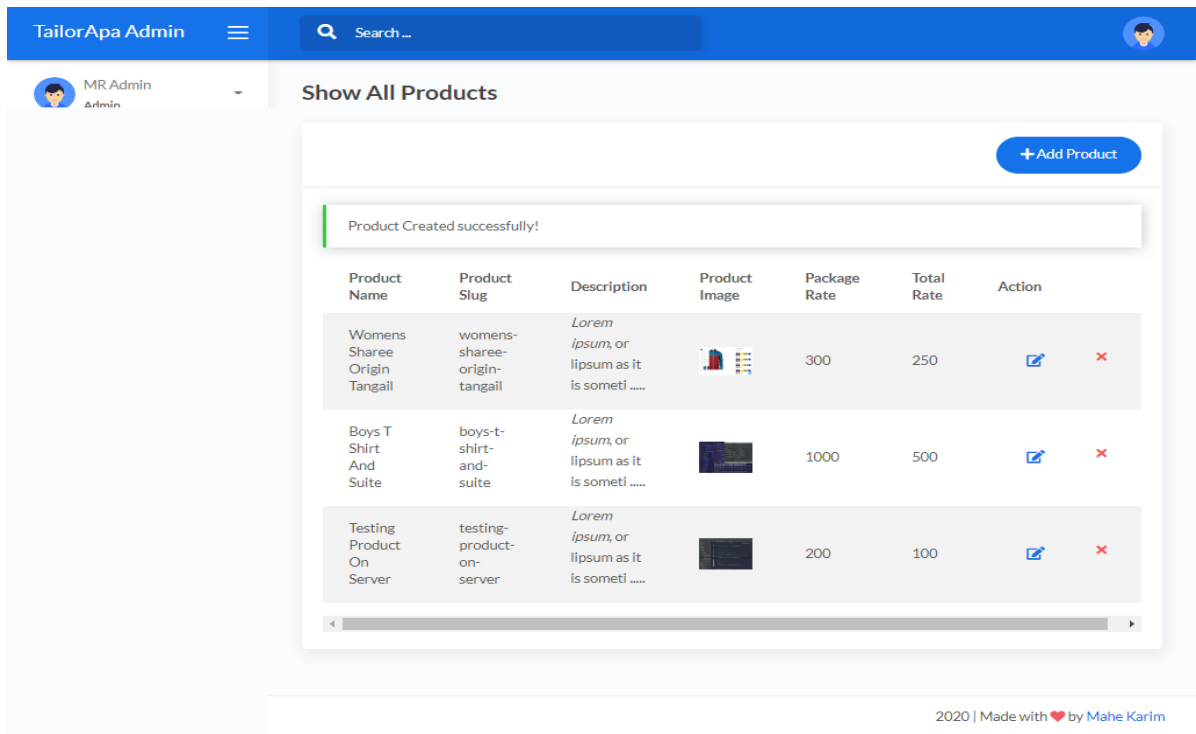

# CHAPTER 5: TESTING AND DISCUSSION

## 5.1 Testing

In this process, the whole system is investigated and track whether there is error or bugs in the system. we have tested our system in multiple ways. These processes are given below:

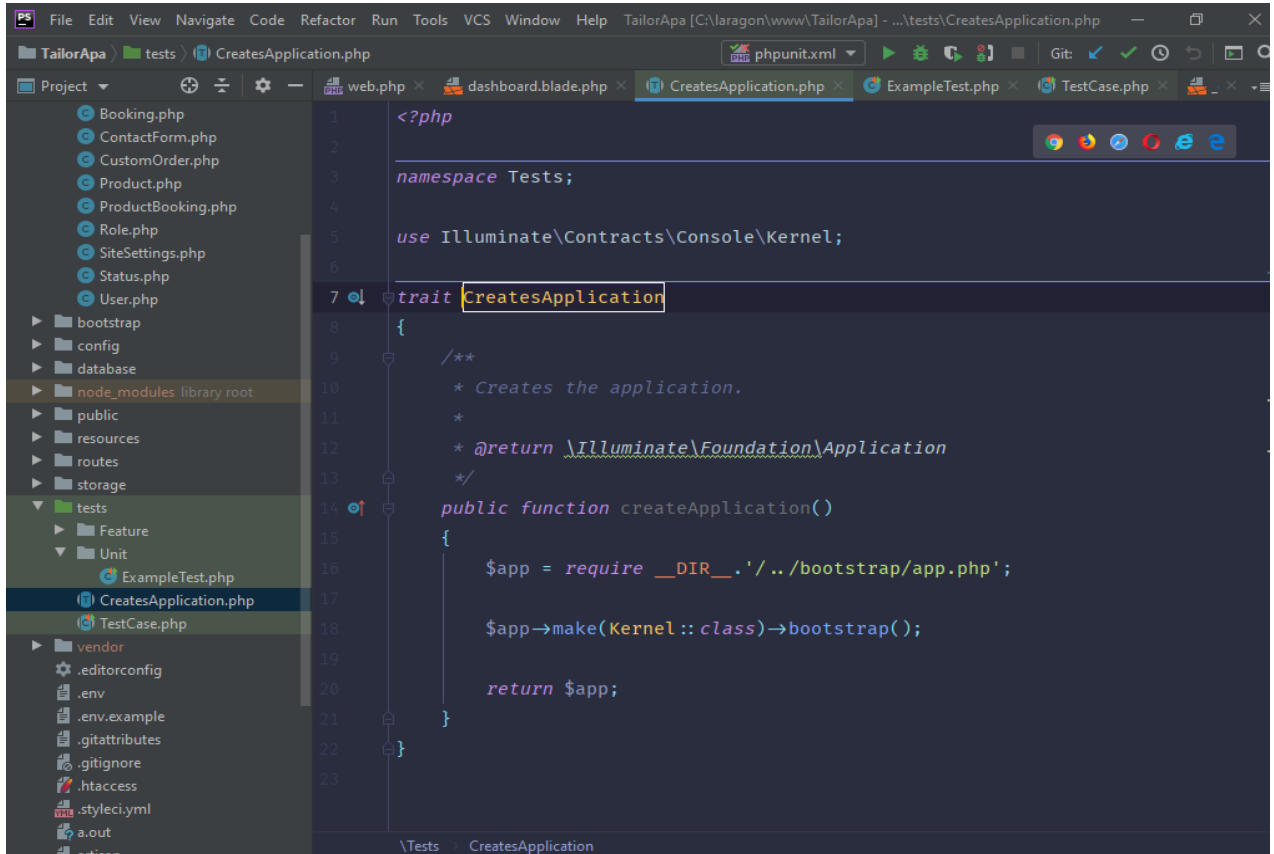

### 5.1.1 Usability Testing

Usability testing is a process where user interface is easy too use or not. We have to create an easy interface that can control all kinds of user. So remove the bug that we face the first time we have to solve.

**Figure 5.1.1 usability testing**

Laravel has built-in testing solution. Selecting a framework like Laravel there is one more reason. This framework made our work so easy. We have pre built system and configuration that we can use so easily.

```
<?php
namespace Tests;

use Illuminate\Contracts\Console\Kernel;

trait CreatesApplication
{
    /**
     * Creates the application.
     *
     * @return \Illuminate\Foundation\Application
     */
    public function createApplication()
    {
        $app = require __DIR__.'/../bootstrap/app.php';

        $app->make(Kernel::class)->bootstrap();

        return $app;
    }
}
```

**Figure 5.1.2 usability testing**

We fixed the database, backend, routing system, basic security system and make sure that this is bug free platform.

```

C:\laragon\www\TailorApa (master -> origin)
λ php artisan route:list
+-----+-----+-----+-----+-----+-----+
| Domain | Method | URI | Middleware | Name | Action |
+-----+-----+-----+-----+-----+-----+

```

**Fig: 5.1.3 – Bug Free Routing System**

## CHAPTER 6: CONCLUSION AND FUTURE SCOPE

### 6.1 Discussion and Conclusion

Nowadays people are depended on the Internet. But they can want everything within a short time. Our website helps them to find out the discount on their expected product in their expected area. Who are starting their new business and wants the maximum reach of their area based customer, this website might help them. Not only area based this website will help the customer for who are more concern about their privacy. From home they can order their dress, custom dress. Our delivery boy will sent their products to home. Before reach the product to home user can see the dress making progress status from their dashboard.

### 6.2 Scope for further Development

Now on our website, there are very few options. But in the future, we will add many options like

- Review option
- Social media sharing option
- Premium membership
- Deep learning
- User reminder facility
- Sell and buy option through Bkash, Rocket
- Android app facility.
- Push Notification To All Member.
- More Dynamic & Efficient Dashboard For Realtime Data
- Fully e-commerce platform
- Automated task and agent system.

Hope this awesome feature will help to our user to make comfortable while they browse our website and purchasing product.
