

# **Study on Determination of Electricity Distribution Cost of Narayanganj PBS-1**

**A Thesis submitted in partial fulfillment of the requirements  
For the Award of Degree of  
Bachelor of Science in Electrical and Electronics Engineering**

**Submitted By  
Md. Saroat Sabin Tonmoy  
ID: 152-33-2614  
&  
Monir Hosain  
ID: 152-33-2635**

**Supervised by  
Professor Dr. M. Shamsul Alam  
Dean  
Faculty of Engineering**

**DEPARTMENT OF ELECTRICAL AND ELECTRONICS ENGINEERING  
FACULTY OF ENGINEERING**

**DAFFODIL INTERNATIONAL  
UNIVERSITY**

**July-2019**

## Certification

This is to certify that this thesis entitled “**Study on Determination of Electricity Distribution Cost of NPBS -1**” is done by the following student under my direct supervision and this work has been carried out by him in the laboratories of the Department of Electrical and Electronic Engineering under the Faculty of Engineering of Daffodil International University in partial fulfillment of the requirements for the degree of Bachelor of Science in Electrical and Electronic Engineering. The presentation of the work was held on.

### Signature of the Candidate

Name: Md. Saroat Sabin Tonmoy

ID: 152-33-2614

Name: Monir Hosain

ID: 152-33-2635

# DECLARATION

The thesis entitled “**Study on Determination of Electricity Distribution Cost NPBS -1**” submitted by **Name: Md. Saroat Sabin Tonmoy, ID No: 152-33-2614 & Name: Monir Hosain, ID No: 152-33-2635**, Session: Summer-2015 has been accepted as satisfactory in partial fulfillment of the requirements for the degree of **Bachelor of Science in Electrical and Electronic Engineering**.

## Countersigned

---

Dr. M. Shamsul Alam  
Professor and Dean  
Department of Electrical and Electronic Engineering  
Faculty of Engineering  
Daffodil International University

**Dedicated to**  
**My Parents**  
**And**  
**Teachers**

# ACKNOWLEDGEMENT

First we express our heartiest thanks and gratefulness to almighty Allah for his divine blessing makes our possible to complete this thesis successfully.

We feel grateful to and wish our profound our indebtedness to Supervisor **Professor Dr. M. Shamsul Alam, Dean, Faculty of Engineering**, Daffodil International University, Dhaka. Deep knowledge & keen interest of our supervisor in the field of Electric power influenced us to carry out this thesis. His endless patience, scholarly guidance, continual encouragement, constant and energetic supervision, constructive criticism, valuable advice at all stage made it possible to complete this thesis.

We also want to convey our thankfulness to our thesis co-supervisor Md. Israfil **Lecturer, Department of EEE**, for his help, support and constant encouragement.

We would like to thank our teachers, entire course mate, thesis team members and friends in Daffodil International University, who took part in this discuss while completing the course work. Finally, we must acknowledge with due respect the constant support and patients of our parents.

## Abstract

This thesis is on “Study on Determination of Electricity Distribution cost of Narayanganj PBS-1”.

Electricity distributions convey information on internal system operation to the actors involved. Electricity pricing is, then, of major importance both in liberalized and regulated systems. Most electricity consumers interact with the industry only through the price they pay for these service. Consequently, good tariff design reflects industry regulation as a whole and is the instrument used to provide consumers with the right signals. Day by day the challenge becomes really to harder to meet up power crisis, especially to meet up power crisis in rural area. So government formed Rural Electrification Board (REB) from Bangladesh Power Development Board (BPDB) to fulfill the power demand for village people. Tariff rate of electrical power depends on transmission and distribution cost. This thesis study on electricity import of Narayanganj PBS-1 consumer levels and their unit consumption in different season and cost associated electricity supply. This Paper also finds the total Distribution cost, Distribution cost per unit, supply cost, supply cost per unit, total revenue, total revenue per unit, energy purchase cost, system loss, surplus etc. This paper will also be helpful to get knowledge a stable electricity distribution structure to meet the future electricity crisis of Bangladesh. Electricity distribution cost is important issue in our country. Because electricity tariff rate and distribution cost are related with our economic growth. Although distribution costs are usually the largest part of the access tariff (or use of system charge), there is not a universally accepted methodology for distribution pricing. The earliest attempts at cost allocation conformed what is now known as the accounting approach, based on business accounting. In recent years, the proposals have focused on two approaches: the application of long-term marginal (or incremental) cost and the cost-causality principle. Although the former aims to achieve a better economic signal, because of the difficulties surrounding its implementation, the most usual solution applied in practice draws more heavily from the causality principle

# **CHAPTER 1**

## **INTRODUCTION OF BREB AND NARAYANGANJ PBS-1**

### **1.1 INTRODUCTION**

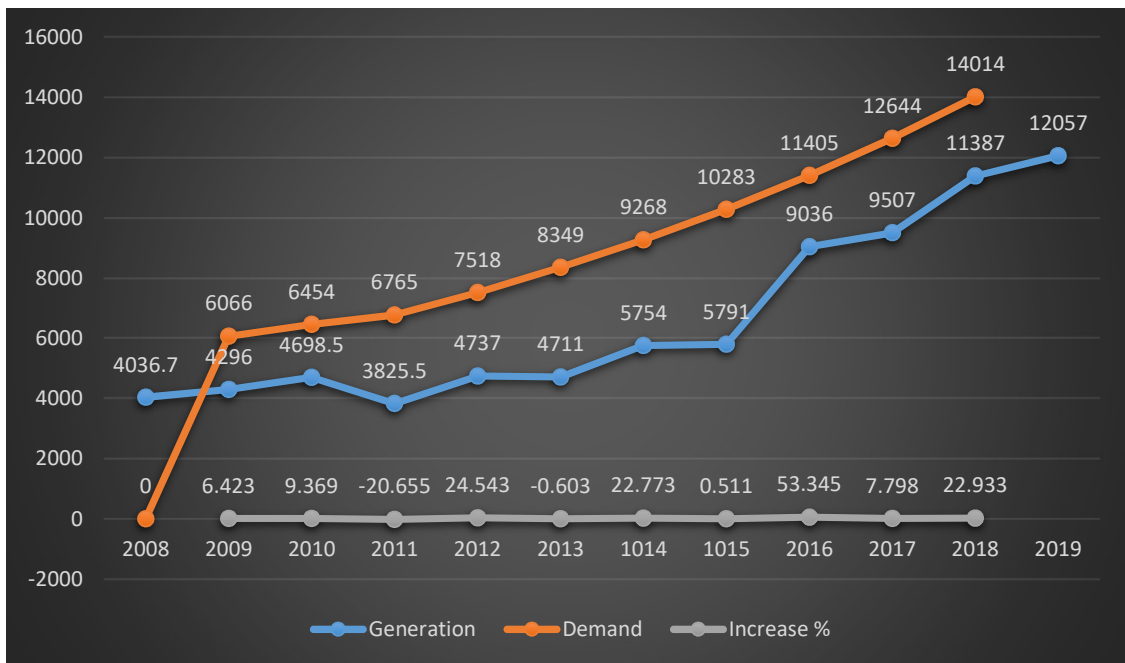

Power is the Production and development genius on any country. Electricity is essential for maintaining the living standard and the necessary of development. In the 18th century developed countries have been using electricity commercially whereas in Bangladesh in a small-scale trading of the liquor city was introduced in 1901. Mr. Bolton, British citizen, switched on the first electricity in Ahsan Monjil on 7 December 1901. Generation power of different power plants all over country is evacuated and transmitted through PGCB'S integrated grid system. There is many distribution company, Such as DESCO, BREB, WZPDC, DPDC, BPDB. Reb is one of the branches of PBS. We will calculate the profit and loss of these PBS. We will also find out how to provide electricity at a lower cost, we will study it.

### **1.2 Bangladesh Rural Electrification Board (BREB)**

Bangladesh Rural Electrification Board or BREB is the organization run by the Bangladesh government. It is distribute the most power in Bangladesh. It was established in 1977. It provides power to the rural areas of Bangladesh and builds electric lines and sub-station. A typical and organizational rural electrification program was not present in the 1970s. The electrification program operated by Bangladesh Power Development Board (BPDB), was mainly limited to the city the best in the center and their peripheries. At that time, the Government of Bangladesh engaged two consulting firms of USA to carry out a comprehensive feasibility study on rural electrification in Bangladesh. The Rural Electrification Board of Bangladesh has been serving rural households for more than 39 years. The board has rapidly expanded the rural electrical connection.

**Table 1.1: BREB Total Generation, Demand, Scarcity (2008-2019)**

Year	Generation MW	Increase % or Decrease %	Demand MW	Scarcity MW
2008	4036.7

### 1.3 PBS

Palli Bidyut Samity (PBS) is playing a vital role in Agricultural, Industrial and Socio-Economic Development of rural area. The rural electrification program, operated by the Rural Electrification Association, has made a progress in developing the socio-economic structure of the countryside in Bangladesh. There is 80 PBS in Our Bangladesh. By 2021, all the people of the country are brought into electrical service.

## 1.4 Narayanganj Palli Bidyut Samity-1 (NPBS-1)

Since its inception in 1986, Narayanganj Palli Bidyut Samity-1 is playing a vital role in Industrial and Socio-Economic Development of Narayanganj District. The Rural Electrification Program conducted by Narayanganj Palli Bidyut Samity-1 has acted a leap-forward in the development of socio-economic structure of rural areas in Narayanganj District. It has significant and sustained impact on industrialization and business & commercial activities in the rural areas.

**Table 1.4: Some Information of Narayanganj Palli Bidyut Samity-1 (NPBS-1)**

No	Heading	Value
1	Officially the date of electrification	01-007-2005
2	Geographic area	257.54 sq km
3	Number of upazila	03 (Sonargaon, Bandar, Rurganj(Partial))
4	Number of unions	18
5	Number of zonal offices	04 (Sonargaon, Bandar, Modonpur, Tarabo)
6	Total number of villages	690
7	Number of electrified villages	689
8	The amount of built-in line	2245 km
9	Connection facility creation	2,61,593 people
10	Sub-station number	16
11	Maximum demand	65 MW
12	System loss (up to June / 18)	3.61%
13	Customer number	Residential = 2,44,136, commerce = 10,229, industries = 3,262, Charitables & others = 3,966, people

## 1.5 Future Plans

Since independence, the power sector in Bangladesh has been represented by the Bangladesh Power Development Board (BPDB) which has been responsible for power generation, transmission and distribution in the country. In recognition of the need to improve the sector's performance, GOB, in consultation with the main development

partners, adopted a policy called 'Power Sector Reforms in Bangladesh' (PSRB) in 1994. Enhancement of imported energy infrastructure and its flexible operation. Efficient development and utilization of domestic natural resources (gas and coal). Bangladesh will bring full electricity under in 2021. Recently announced the generation of 24,000MW by 2021. It's nigh impossible! Most of the projected coal-based power stations are yet to be set up. As per the draft report, the demand for power by 2041 would be 82,000MW, instead of 61,000MW, if the efficiency and conservation programme is not implemented. By that time, the generation capacity would reach 94,000MW. The draft report states that LNG will be the basic fuel to generate power in 2041 as its market has widened gradually. By that time, the share of LNG in power generation resources will be 43 per cent. It will be 32 per cent for coal, 15 per cent for imported coal, and 10 per cent for others (hydro, liquid fuel, nuclear and renewable sources). In the draft document, the demand for power has been predicted as: 12,874MW in 2018, 18,374MW in 2021, 27,009 MW in 2025, 39,670MW in 2030 and 77,285MW in 2041. Currently, Bangladesh has 385,000 km of distribution lines, but they should be extended to 783,000 km to achieve the target.

**Table 1.5: Future plan for Installed Capacity**

Technology	Percentage of Production	Installed Capacity by 2050 (MW)
Residential rooftop solar	27.8%	66637
Commercial & government rooftop solar	7.8%	19026
Solar plants	40%	94722
Concentrated solar plant (CSP)	11.9%	10915 (additional 6548 MW of CSP and 28375 MW of solar thermal for heat to address intermittency of wind and solar)
Wind (Onshore)	5.8%	5944
Wind (Offshore)	5.8%	13077
Wave energy	0.5%	1584
Tidal energy	0.1%	150
Hydro power	0.3%	230
Geothermal	0%	0
Total	100%	212285

## 1.6 Changes in Bangladesh due to electricity generation

Electricity is a flexible form of energy and critical resource for modern life and a vital infrastructural input for economic development. In all economies, households and

companies have extensive demand for electricity. This demand is driven by such important factors as industrialization, extensive urbanization, population growth, rising standard of living and even the modernization of the agricultural sector. There is widespread discussion and research over the topic of relationship between electricity consumption and income particularly since early seventies of the last decades

Electricity is a major source of energy in the industrial and agricultural sectors in Bangladesh. These two sectors collectively contribute to 50.3 percent of Bangladesh's GDP. The contribution of agricultural and industry sector to GDP in fiscal year 2010-11 was 19.9 percent and 30.4 percent respectively (Bangladesh Bank, 2012). The share of agriculture and industry sectors in electricity consumption is increasing gradually. According to the Bangladesh Power Development Board (BPDB) statistics, about 45 percent (1995 to 2010) of total electricity was consumed by agriculture and industrial sectors. These statistics indicate that industry and agriculture together contribute significantly to GDP and electricity consumption as well. From this we can infer, therefore that electricity consumption plays an important role in economic growth of Bangladesh.

## **1.7 Outline**

This Thesis/Project is organized as follows:

Chapter 1: Introduction of BREB and NPBS-1

Chapter 2: Literature Review

Chapter 3: Socio Economic Impact of REP in Bangladesh

Chapter 4: Import Energy of NPBS-1

Chapter 5: Revenue and Consumers of NPBS-1

Chapter 6: Electricity Cost and Rate

Chapter 7: Conclusion

# CHAPTER 2

## LITERATURE REVIEW

### 2.1 Literature Review

Generation plants consist of one or more generating units that convert mechanical energy into electricity by turning a prime mover coupled to an electric generator. The ability of generation plants to supply all of the power demanded by customers is referred to as system adequacy. Three conditions must be met to ensure system adequacy. First, available generation capacity must be greater than demanded load plus system losses. Second, the system must be able to transport demanded power to customers without overloading equipment. Third, customers must be served within an acceptable voltage range. Distribution reliability is one of the most important topics in the electric power industry due to its high impact on the cost of electricity and its high correlation with customer satisfaction. While scrupulously correct in theory and mathematics, provides a wealth of practical experience and useful knowledge that can be applied by any electric power engineer to improve power distribution reliability performance.

G.A. Putnus, P. Suwanaping Karl, D. Johnston, E. C. Bentley, M. Narayana said that fossil fuel consumption will be increased to increase the country's development or economic capability. He also said that the use of electricity-driven vehicles is still very low, but its use will grow very quickly, because continuous our mineral resources start to fall. This paper presents the results of an analysis of the impact of electric vehicles on existing power distribution networks. [1]

Helene Ahlborg and Linus Hammar reported that Mozambique and Tanzania are countries with very low rural electrification rates. There are significant barriers to effective rural electrification by grid-extension and off-grid installations. The main drivers are political ambitions based on expected growth of demand. The barriers are related to lack of access

to human capital, to difficulties in planning and donor dependency, to low rural markets and little interest from private sector and to more technical matters.

Yohanis, Mondol, Wright and Norton reported that Domestic energy consumption depends on the location, design together with the efficiency of appliances and the behavior and socio-demographical characteristics of and construction of a dwelling, and the specification of heating systems and their controls occupants [5].

M.S. Alam, E. Kabir, M.M. Rahman, M.A.K. Chowdhury are written in their paper that The most pressing problem in the power sector has been with the distribution system in Bangladesh since her independence; which is characterized by heavy system loss and poor collection performance. They told a solution to make it efficient and effective; its administration must be restructured. At the same time, its performance should be monitored continually on the basis of particular performance indicators.[1]

Boris Dodonov, Petra Opitz, Wolfgang Pfaffenberger reported that Increasing the electricity tariffs for private consumers to cost-covering levels has been a very sensitive issue for all transition countries.[2]

Eric Sortomme, Mohammad M. Hindi, S. D. James MacPherson, and S. S. Venkata reported that Coordinated Charging of Plug-In Hybrid Electric Vehicles (PHEVs) can reduce the distribution system losses. They also said that As the number of plug-in hybrid vehicles (PHEVs) increases, so might the impacts on the power system performance, such as overloading, reduced efficiency, power quality, and voltage regulation particularly at the distribution level.[3]

Without efficient, clean energy, people are undermined in their efforts to engage effectively in productive activities or to improve their quality of life. [4]

They also pointed that the electrical energy demand of a household can vary each hour of every day, weekdays and weekends, and for different months of the year. EBL Securities

reported in their project that incessant supply of power and energy is the prerequisite for the progress of an economy. The importance of energy is even more supplementary in the context of Bangladesh, an emerging economy that has been experiencing rapid economic growth but also has been experiencing prolonged period of energy crisis. Electricity is the main form of energy that is tapped on both private and commercial scales in Bangladesh. However, the country is still at a very low level of electrification. The government of Bangladesh has set a target to bring the whole country under electricity coverage by 2021. A long term plan of power generation up to 2030 was made in Power System Master Plan (PSMP)-2010. The power demand in Bangladesh is projected to be 33,708 MW by 2030 [6].

Hao and Alex write in their report Reactive power pricing and management under open-access will depend upon two important developments: 1) the functional unbundling of facilities that support the reactive power and voltage control service, 2) grid rules to facilitate the coordination between generation and transmission system for reliable system operation. [7]

G.A.Putnus,P.Suwanaping Karl,D.Johnston, E.C.Bentley, M. Narayana said that. The market for battery powered and plug-in hybrid electric vehicles is currently limited, but this is expected to grow rapidly with the increased concern about the environment and advances in technology. Due to their high energy capacity, mass deployment of electrical vehicles will have significant impact on power networks. This paper presents the results of an analysis of the impact of electric vehicles on existing power distribution networks [8].

R.SrinivasaRao,K.Ravindra,K.Satish ,S.V.L.Narasimhamrepresented that a new method to solve the network reconfiguration problem in the presence of distributed generation (DG) with an objective of minimizing real power loss and improving voltage profile in distribution system. Different scenarios of DG placement and reconfiguration of network are considered to study the performance of the proposed method. The method has been tested on 33-bus and 69-bus radial distribution systems at three different load levels to demonstrate the performance and effectiveness of the proposed method [9]

Michael Caramains, Justin M. Foster considered that the management of electric vehicle (EV) loads within a market-based Electric Power System Control Area. EV load management achieves cost savings in both (i) EV battery charging and (ii) the provision of additional regulation service required by wind farm expansion. A hierarchical decision making methodology is proposed for hedging in the day-ahead market and for playing the real-time market in a manner that yields regulation service revenues and allows for negotiated discounts on the use of distribution network payment [10]

Market has been established based on the assumption of open access and nondiscriminatory use of the T&D assets. This paper focuses on the distribution pricing methods and suggests one that is currently under development in Brazil. This method is based on incremental costs derived from the aggregated expansion plan of a particular utility, named model utility [11]

# Chapter 3

## SOCIO-ECONOMIC IMPACT OF REP IN BANGLADESH

### 3.1 Introduction

The Rural Electrification Program in Bangladesh began in 1978. Primarily with the technical assistance of National Rural Electrification Cooperative Association (NRECA), Rural Electrification Board started their journey in 1976 with an aim to provide electricity outside the urban strata. The program is based on the concept of member-owned Palli Bidyut Samities (PBSs) similar to the rural electric cooperatives that exist in the United States. PBSs as the model of local governance act as nucleus of REP. Seventy-eight PBSs have been organized to date in Bangladesh. REP aimed initially at electrification of irrigation pumps and tube-wells, agro-based industries and serving domestic and commercial loads of only those villages, which fall right alongside the electrical distribution facilities built for irrigation purposes. To date, electricity made available through PBS areas, is intended to be used for all possible applications that serve the purpose of improved living conditions of the rural people. This can be achieved and has been achieved to a large extent (present research findings substantiate this) by introducing electricity into households (e.g., for lighting and domestic appliances), into rural industry (e.g., for powering tools), and into agriculture (e.g., for water pumping in irrigation systems, raising farm yields), in to market places, and into public (street lighting, power and cooling of medicines or vaccines in medical centers) to ensure improved health facilities, lighting in schools, offices and other institutions.

### 3.2 Economic and Social Impact

#### 3.2.1 Household level

The economic and social effects of rural electrification at the household level are multi-dimensional, and both are real and inappropriate. The electricity has brought light to many families, hitherto remaining in complete darkness. It has given them the enlightenment towards modern living, freedom from poverty, malnutrition and hunger. Rural's consume above 65 percent of supplied electricity in household level in 2015. The people of household level now have much better work-habits and an improved sense of discipline and social security, which came as a result of the assurances of basic amenities in life. Rural Electric Societies have provided jobs to rural families/youths. In addition, a total of 8000 persons are employed in the construction firms and consulting offices working for the program. Presently 55.41% villages and 5.08 million rural households are electrified and no. of beneficiaries are 30.5 million.

### **3.2.2 Impact on commercial activities**

Rural electricity has worked as a leap-forward for the development of commercial activities in rural Bangladesh. Electricity irrigation pumps, industrial and commercial shops create a direct employment opportunity of 5.06 million. Rural electricity has deep and remote economic, socio-cultural and demographic impact of the life and living of the rural masses in Bangladesh. It has significant and lasting impact on agricultural growth, industrialization and business and commercial activities. It affects the formation of capital through knowledge building through electricity-driven media exposure. Thus, in order to accelerate the process of economic growth, strengthening pro-poor orientation in the growth process, attain the millennium development goal with an emphasis to PRSP and to further boost up human development in Bangladesh access to electricity of the households and social and economic institutions should be expanded within shortest time

### **3.2.3 Impact on education**

Compared to non-electric families, the overall literacy rate of both men and women was significantly higher in terms of electricity, especially due to the use of electricity in the household, which contributed a lot to increase the awareness of economic and educational standards. The poor-poor divide is less pronounced in the power plant than the non-power

plants. Measurement on education, final examination, school dropout, school attendance rate and the number of students spent at night spent studying at the number (grade) - all the power centers have improved very much. Compared to non-electric power. Literacy rate in the rural areas has increased significantly due to the expansion of mass education program. Power issues to improve the quality of education. These qualitative improvements in power plants work through many channels: due to high quality of time after sunset, due to adequate lighting and comfortable fans, quality of the time increases the appetite for knowledge-based strengthening education due to TV access), parents (especially mothers / other senior female members) To help children in education compared to the previous generation Gives more time. Literacy rate in the electrified households is 71%, where 54% in the un-electrified households. Poor workers can attend the night schools at the end of the day's business. They can also sit beside the children to supervise their education.93.7% children increase there study time.

### **3.2.4 Impact on Ownership and Assets**

The higher proportion of electrified households is the cultivable land compared to their cultivable non-electric families. The report related to the undemocratic economic and social impact assessment study of rural electrification program in Bangladesh was 59%: At the cost of electricity, the HDRC Viii family 73% households for electricity consumption. The electrified household own cultivable land is 178.2, the average-EV is 74.2, and WE-NEV, 147.8 decimals. About 79% of the electrified households (HE) reported ownership of cultivable land.

### **3.2.5 Impact on Gender Dimension**

Electrification contributed to the positive development of women's socio-economic status. Power mobility, participation in IGA, decision making, freedom of income and savings, good use of loans, knowledge of gender discrimination problems, housing plans on the basis of convenience, change of attitude among benefits, has a profound effect on electricity. Reducing health care discrimination, increasing the overall schooling for children and girls for school, sending girls to schools, awareness of legal issues (for

example, marriage of 18 years of girls and boys at the age of 21) and awareness of negative impact dowry.

### **3.2.6 Impact on industrial development**

Industrial electricity is the second highest consumer by using 42.3% of total MWH. Over the past twenty years, the total number of rural electricity industries increased by 3210 times, and the average number of industrial connections per PBS increased by 550 times. A significant increase in industrial output (in both cases of volume and value) has been identified in the research. In the last five years, the rate of increase in the electricity industry was 295%. Output volume (Tone) increased by 78 percent, the same growth was only 8 percent in non-electrical industries. The output of the piece unit (excluding tons and pulse) has increased by 121% in volume electricity, and in the last five years it was -0.44% (negative) in non-electric industries.

### **3.2.7 Employment Sector**

Electricity generates employment. Employment impact was both direct and indirect. In agricultural fields, the estimated population involved in direct farming using rural electricity connections. Currently, 63322 employs 983,829 persons using industrial rural electricity; and electrified industries generate 11 times more jobs than non-electric industries. Rural and wholesale shops employ 848,630 people using rural electricity. There are 16,223 direct employment in PBS. Further, electrified females are more involved in household-level income-generation activities than women without electricity, and time is restored for useful employment; the unemployment rate is relatively less than the electric family. And indicates the effect of the modernization of electricity by occupying more than half of the electrified family's non-agricultural employment. At the top of them, rural electrification on employment has huge impact on employment support services.

### **3.2.8 Cultural Sector**

Electricity enlightens people. Human development is not possible as a condition of increasing human opportunities and choices without providing electricity benefits to the

public. The impact of electricity affects the social and cultural development of individuals, families and communities. This effect mediates through watching channels, listening to the radio, during extended discussions, etc. through various intervention channels like handmade and behavioral changes. Changes in economic life (income, employment, expenditure, savings, credit, asset building, already discussed) together with varying levels of changes in social and cultural life have resulted in multiple synergistic effects for developing agents. Which, determine the role of electricity. In this way, "Power as a Mediating Agent for Social and Cultural Development", based on this trend, present in the following relevant broad areas the power impact analysis: education, health hygiene, gender empowerment, gender disparities, and changing status, attitudes and ideological changes, extended time and time allocation, and social Modernization as environmental and protective security.

### **3.2.9 Impaction Irrigation and Agriculture Production**

RRP has contributed significantly in the field of agriculture, production and utilization of skilled irrigation equipment to achieve food self-sufficiency and creates stable employment opportunities. Generally, electricity irrigation machinery is more reliable than diesel. Compared to diesel operators, the average cost of three-quarters of the power equipment is cost effective and energy expenditure. Electric-centric irrigation equipment creates employment for two to two people annually and by generating one hundred thousand additional jobs throughout the year in rural areas of the country by irradiation of irrigation equipment. Electricity has intensified land use intensity and cropping intensity and its operation cost is less than the diesel equipment (including breakdown and related problems), and irrigated on other types of irrigation. Works with nearly 0 percent pollution of electrical equipment. This is "more clean and safe than driving in the del.ic." Power contribution clearly evident in the agricultural sector of Bangladesh, so on one hand more generation of electricity, and better delivery of others, proposed. Initial operation of irrigation pump connection to RRB and its mission / target to connect with electricity generation.

### **3.2.10 Social Impact of Mass Media**

Due to all the surplus movement of the family, industrial and seed power plants from one majority area to the non-electrified area, the power centers have shown many economic trends measured by the high speed movement of their economic power.

### **3.2.11 Impact on Health, Hygiene and Sanitation**

The key to human health is the health condition of human. For this reason, the longevity (birth of birth expectancy) of human beings, which is officially accepted as the number one variable in measuring the measurement of human development or human deprivation, is essentially a function of health. Relations between health, poverty reduction and economic growth are generally much stronger than understanding. The WHO Commission in Macroeconomics and Healthy challenges the traditional argument that the reason for the economic development is that health will automatically improve health is the opposite: Contrary to the fact: In a developed country, an urgent need for economic development in the poor country. The Commission's roadmap report says, "Health is a central input to prioritize its own rights, economic development and poverty reduction, increased investment in health will increase billions of dollars to increase income. Whereas, a function of health practices and behavioral health awareness (among others), has been analyzed later. Such awareness is mediated through many agents, among which television is a major issue. So, in all possible health related issues, the role of electricity was detected by electric equipment, especially in the use of TV as an agent. The effects of electricity on health (or effects) are not only through the TV, but also through the other benefits of freezing, fan, modern diagnostic facilities (only possible if electricity is available).

## **3.3 Summary**

Rural electrification reflects positive effects in both social and economic sectors. Rural electricity industries play an important role in transforming the livelihood of rural people with agricultural productivity till the arrival of rural electrification. Rural area of Bangladesh is 90%. We can develop rural electrification technologies, at the same time the country will be improved.

# **CHAPTER 4**

## **IMPORT ENERGY OF NARAYANGANJ PBS-1**

### **4.1 Introduction**

Electricity is the most important part in our developing country and any country. In view of the increasing demand for electricity around the world, Bangladesh is no exception. Daily demand of electricity is increasing in Bangladesh. For the economic release and to meet consumers' needs, electricity is increasing, power generation is increasing, generating more transmission / distribution capacity, increased electricity / more population through electricity supply and it is important to ensure more efficient management. Bangladesh has already a Bilateral Agreement with India under which about 1200 MW of power can be imported. The government of Bangladesh (GoB) has decided to set up power plants in the private sector and the independent electricity generator (IPP) has launched their business in Bangladesh.

### **4.2 NPBS-1 Imports from BPDB**

To meet the demand of consumers and to meet the requirements of NPBS-1, directly bought Electricity from Government sector. In this chapter we discuss about Energy Purchase and purchase cost from Public and private sector for Three year (2015-2016, 2016-2017, 2017-2018), also explain about different grid capacity, supply and peak demand, system loss, KWh sold to the consumers.

### 4.3 Data Analysis

**Table 4.1: Energy Import of NPBS -1, 2015-16**

Name of Substation	July'15			August'15		
	Unit kWh(Purchase)	Total KWh(sold)	SL %	Unit kWh(Purchase)	Total KWh(sold)	SL %

Energy imports analysis has been shown in Table 4.1, 4.2, 4.3. Electricity demand in Bangladesh changes in some seasons, like as winter, summer, and rainy.

We try to show relevant analysis for winter and summer seasons. June 2016, the energy import is 367,430,911 units, May 2017, the energy import is 120,532,454 units, March 2018, the energy import is 131,216,026 units, which is high import from previous months and system loss is also comparatively low and it's an effect of summer season because in the summer, energy consumption of different consumer is high, especially for domestic side. Same as at March, 2016 the energy import is 102,627,942 units which is also quite high.

On the other hand, the energy import for the month of July, August, September, October, November, December, January and February are low to compare as other months of the year. It is seasonal effect of winter when the domestic consumer consume lower amount of electricity and same as some industries are consume lower amount of energy as per demand of production. In December 2015, the energy import is 67,429,546 units, In December 2016, the energy import is 99,084,150 units, In December 2017, the energy import is 112,482,169 units, which is low import from previous month and January 2016 and February 2016, January 2017 and February 2017, January 2018 and February 2018 the energy import quite same and the system loss is also quite same. Again the energy import demand is high for the month of March, April, May and June 2016. For June 2016, energy import is 367,430,911 units which is the highest amount of import for the year and the system loss is also comparatively high 1.98 MU. Also we present energy import scenario in this chapter by showing graphical figure.

## 4.4 Graphical Analysis

**Fig 4.1: Month wise Energy Import (MU) of NPBS-1 (2015-2016)**

The above graphical state shows that, the energy import is high in August, September 2015 and March, April, May, June 2016. On the other hand, energy import is comparatively low in July 2015, November, December 2015 and January, February 2016. Season to season the energy import and supply to the consumer may vary. Maximum import electricity in June 16 (2015-2016 fiscal year), because there is many new connected substation and more load Growing.

**Fig 4.2: Month wise Energy Import (MU) of NPBS-1 (2016-2017)**

The above graphical state shows that, the energy import is high in August, October 2016 and March, April, May, June 2017. On the other hand, energy import is comparatively low in July 2016, November, December 2016 and January, February 2017. Season to season the energy import and supply to the consumer may vary.

**Fig 4.3: Month wise Energy Import (MU) of NPBS-1 (2017-2018)**

The above graphical state shows that, the energy import is high in August, October 2017 and March, April, May, June 2018. On the other hand, energy import is comparatively low in July 2016, November, December 2017 and January, February 2018. Season to season the energy import and supply to the consumer may vary.

#### **4.5 Substations of NPBS-1**

There are 36 sub-stations under NPBS-1, which connected with various grids. Energy storage and consumption various form one substation to another substation based on the location, consumer demand, industrial zone, transmission distance and many factors. The imported energy may reduce during the transmission process due to system loss.

Below is the name of the NPBS-1 substation.

1. Sonargaon
2. Meghnaghat-1
3. Meghnaghat-2
4. Ananda Baza
5. Head Office
6. Noyapur
7. Modingonj-1
8. Modingonj-2
9. Modingonj-Dasergao
10. Tarabo-1
11. Tarabo-2
12. Borpa
13. Horipur GIS
14. BSIC Kanchpur
15. Bhulta-Kanchan
16. Bhulta-REB Ring-2
17. Horipur-Meghnaghat
18. Horipur-Narsingdi

19. Horipur-Kanchan
20. Horipur-Demra
21. Horipur-Rohim steel
22. Sonargaon-Meghnagh
23. Sonarhaon-Narsingdi
24. Horipur-PGCBL
25. Horipur-Sonargaon-1
26. BASIC Kannchpur
27. Nara PBS-2 HP GT-1
28. Nara PBS-2 SPPCL
29. Head Quarte Express
30. Narayanganj
31. Everest PGCL(33kv)
32. Ananda Baza(Othe)
33. Abdul Monem Ltd.
34. Kabilgonj SS
35. Akhalia SS
36. Horipur-Sonargaon-2

## 4.6 System Losses

**Table 4.4: System Loss of NPBS-1 in 2015-16**

Month	Grid Wise Import (MKWh)	Substation Wise Import (MKWh)	Unit Sold at Consumer End (MKWh)	33 KV Loss (MKWh)	Sub-station System Loss (MKWh)	Total System Loss (MKWh)
July	67.2	67.424	61.798	0.224	5.626	5.402
August	78.912	71.171	71.717	7.741	0.546	1.948
September	70.43	71.284	65.685	0.854	5.599	1.751
October	77.368	78.216	73.655	0.848	4.561	1.331
November	71.745	71.99	68.137	0.245	3.853	0.575
December	67.429	67.689	63.597	0.26	4.092	1.161
January	68.033	69.075	65.292	1.042	3.783	0.848
February	83.517	85.034	82.616	1.517	2.418	0.89
March	102.627	102.807	97.597	0.18	5.21	1.901
April	101.472	103.041	96.838	1.569	6.203	2.005
May	98.702	98.936	90.996	0.234	7.94	1.434
June	367.43	369.489	360.151	2.059	9.338	1.791

In Table 4.4, Total System Loss = Grid to sold energy at Consumer end,

Sub-station System Loss = Substation to Sold energy at Consumer end,

33 KV Line Loss = Energy loss between Grid and Sub-station.

We found it from table 4.4, Total loss of energy in summer is much higher than winter. Heat increases the line resistance and resistance makes the amount of loss higher. 33 KV Line losses are quite similar but sub-station system losses differ huge. Where from October 2015 to January 2016; during winter season, system losses were below than 2 MKWh. In July 2015 and June 2016; both of these in summer, we found the total system loss about 3 times higher than winter. PBS says illegal use of electricity is also responsible for this. Illegal use of electricity rise in summer very badly. That's why; loss is much higher in summer. PBS try to stop illegal use of electricity but public awareness can stop this "Thief Loss". PBS also has some loss for storms during summer and rainy season.

**Table 4.5: System Loss of NPBS-1 in 2016-17**

<b>Month</b>	<b>Grid Wise Import (MKWh)</b>	<b>Substation Wise Import (MKWh)</b>	<b>Unit Sold at Consumer End (MKWh)</b>	<b>33 KV Loss (MKWh)</b>	<b>Sub-station System Loss (MKWh)</b>	<b>Total System Loss (MKWh)</b>
July	94.756	94.945	90.269	0.189	4.676	4.487
August	110.314	110.463	103.964	0.149	6.499	1.948
September	96.103	96.511	91.002	0.408	5.509	1.751
October	117.457	117.637	111.165	0.18	6.472	1.331
November	101.356	101.619	99.431	0.263	2.188	0.575
December	99.084	105.784	95.924	6.7	9.86	1.161
January	101.322	99.93	98.952	1.392	0.978	0.848
February	94.49	93.457	92.483	1.033	0.974	0.89
March	109.259	106.628	103.796	2.631	2.832	1.901
April	109.256	110.813	101.794	1.557	9.019	2.005
May	120.532	122.047	110.44	1.515	11.607	1.434
June	111.427	112.575	101.499	1.148	11.076	1.791

In Table 4.5, Total System Loss = Grid to sold energy at Consumer end,  
 Sub-station System Loss = Substation to Sold energy at Consumer end,  
 33 KV Line Loss = Energy loss between Grid and Sub-station.

We found it from table 4.5, Total loss of energy in summer is much higher than winter. Heat increases the line resistance and resistance makes the amount of loss higher. 33 KV Line losses are quite similar but sub-station system losses differ huge. Where from October, 2016 to January, 2017; during winter season, system losses were below than 2 MKWh. In July 2016 and June 2017; both of these in summer, we found the total system loss about 3 times higher than winter. PBS says illegal use of electricity is also responsible for this. Illegal use of electricity rise in summer very badly. That's why; loss is much higher in summer. PBS try to stop illegal use of electricity but public awareness can stop this "Thief Loss". PBS also has some loss for storms during summer and rainy season.

**Table 4.6: System Loss of NPBS-1 in 2017-18**

<b>Month</b>	<b>Grid Wise Import (MKWh)</b>	<b>Substation Wise Import (MKWh)</b>	<b>Unit Sold at Consumer End (MKWh)</b>	<b>33 KV Loss (MKWh)</b>	<b>Sub-station System Loss (MKWh)</b>	<b>Total System Loss (MKWh)</b>
July	118.661	119.004	115.351	0.343	3.653	3.31
August	131.669	132.358	124.403	0.689	7.955	1.948
September	106.8	107.58	105.146	0.78	2.434	1.751
October	124.809	125.563	119.932	0.754	5.631	1.331
November	114.662	115.143	113.814	0.481	1.329	0.575
December	112.482	112.802	109.878	0.32	2.924	1.161
January	109.626	109.978	105.913	0.352	4.065	0.848
February	102.619	102.905	99.329	0.286	3.576	0.89
March	131.216	131.696	120.324	0.48	11.372	1.901
April	120.078	120.847	115.879	0.769	4.968	2.005
May	129.155	132.215	119.927	3.06	12.288	1.434
June	119.781	121.096	110.818	1.315	10.278	1.791

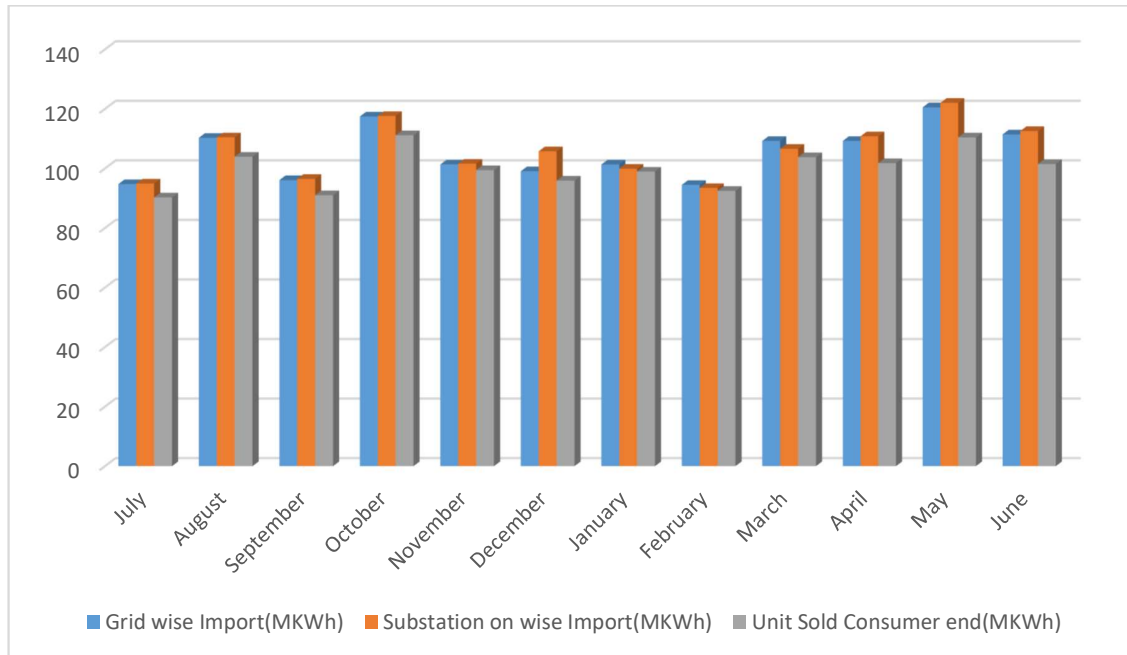

In Table 4.6, Total System Loss = Grid to sold energy at Consumer end,  
 Sub-station System Loss = Substation to Sold energy at Consumer end,  
 33 KV Line Loss = Energy loss between Grid and Sub-station.

We found it from table 4.6, Total loss of energy in summer is much higher than winter. Heat increases the line resistance and resistance makes the amount of loss higher. 33 KV Line losses are quite similar but sub-station system losses differ huge. Where from October, 2017 to January, 2018; during winter season, system losses were below than 2 MKWh. In July 2017 and June 2018; both of these in summer, we found the total system loss about 3 times higher than winter. PBS says illegal use of electricity is also responsible for this. Illegal use of electricity rise in summer very badly. That's why; loss is much higher in summer. PBS try to stop illegal use of electricity but public awareness can stop this "Thief Loss". PBS also has some loss for storms during summer and rainy season.

**Fig 4.4: Grid and Sub-station wise import with Unit sold at consumer end (2015-2016)**

We know that there are certain losses which affect the economy of the power system. It is a well-known fact that all energy supplied to a distribution utility does not reach the end consumer. A substantial amount of energy is lost in the distribution system by way of Technical and Non-Technical losses. The distribution system accounts for highest technical and non-technical losses in the power sector. In Bangladesh, the percentage of transmission and distribution losses has been quite high.

**Fig 4.5: Grid and Sub-station wise import with Unit sold at consumer end (2016-2017)**

We know that there are certain losses which affect the economy of the power system. It is a well-known fact that all energy supplied to a distribution utility does not reach the end consumer. A substantial amount of energy is lost in the distribution system by way of Technical and Non-Technical losses. The distribution system accounts for highest technical and non-technical losses in the power sector. In Bangladesh, the percentage of transmission and distribution losses has been quite high.

**Fig 4.6: Grid and Sub-station wise import with Unit sold at consumer end (2017-2018)**

We know that there are certain losses which affect the economy of the power system. It is a well-known fact that all energy supplied to a distribution utility does not reach the end consumer. A substantial amount of energy is lost in the distribution system by way of Technical and Non-Technical losses. The distribution system accounts for highest technical and non-technical losses in the power sector. In Bangladesh, the percentage of transmission and distribution losses has been quite high.

Distribution line losses are comprised of two types: Technical losses and Non-Technical losses.

#### 4.6.1 Technical Losses

Technical losses in power system are caused by the physical properties of the components of the power system. The most obvious example is the power dissipated in transmission lines and transformers due to internal electrical resistance. The technical losses are due to energy dissipated in the conductors, equipment used for transmission line, transformer, sub transmission line and distribution line and magnetic losses in transformers.

#### **4.6.2 Non-Technical Losses**

Non-Technical losses, on the other hand, are caused by actions external to the power system or are caused by loads and condition that the Technical losses computation failed to take into account. Non- Technical losses are more difficult to measure because these losses are often unaccounted for by the system operators and thus have no recorded information. Non- Technical losses are more difficult to measure because these losses are often unaccounted for by the system operators and thus have no recorded information. For example, if a monthly-read meter is read incorrectly such that the consumption is one month is too low, when the meter is read correctly next month, there will be additional KWh recorded. The missing KWh will initially appear to be losses of electricity.

#### **4.7 Summary**

It is possible to control load demand by proper load management, encouraging Independent Power Producers (IPP) and reducing transmission loss. Initiative should be taken to develop skilled manpower required for the power sector considering incorporating IPP and local Government (GOV), central GOB, private sector may take the responsibility to increase the power generation and ensure its proper use in Bangladesh. The process of energy import and distribution of NPBS-1 is low from some other PBS. NPBS-1 tries to reduce their problems.

# CHAPTER 5

## Revenue and Consumers of Narayanganj PBS-1

### 5.1 Introduction

Electricity is the major source of power for most of the country's economic activities. The largest energy consumers in Bangladesh are industries and the residential sector, followed by the commercial and agricultural sectors. Bangladesh is considered one of the most arousing energy growth nations. Bangladesh has small reserves of oil and coal, but very large natural gas resources. Commercial energy consumption comes mostly from natural gas (around 66%), followed by oil, hydropower, and coal. Non-commercial energy sources, such as wood fuel, and crop residues, are estimated to account for over half of the country's energy consumption.

### 5.2 Description of Consumer Class

Consumer in every PBS under BREB based on their demand and category of energy use eight type's consumer class. Those classes are bellows

#### 5.2.1 Domestic Consumers

Residential load consists of lights, fans, and appliances such as radios, TVs, heaters, electric irons, refrigerators, electric water heaters, washing machines, coolers, air-conditioners, domestic pump sets etc. Domestic consumers are given single phase supply up to a load of 5 kW and a 3-phase supply for load exceeding 5 kW. Domestic consumers are classified into eight slabs. These are types of the other consumer category are follows:

1. Minimum KWh
2. 0-50 KWh

3. 0-75 KWh
4. 76-200 KWh
5. 201-300 KWh
6. 301-400 KWh
7. 401-600 KWh
8. Above 600 KWh

### **5.2.2 Commercial Consumers**

Non-residential premises, such as shops, business-houses, cinemas, hotels, public offices, clubs etc. fall under this category. The load mainly consists of lights, fans and small electric appliances. The load remains fairly constant from around morning 10 to evening 9 hours. During night the load may consist of some lighting load. The demand factor is fairly high. Such consumers are given single phase supply for loads up to 5 kW and three phase supply for loads exceeding 5 kW.

### **5.2.3 Charitable Institute**

Charitable institutes are depends on charity of the Government or any private sector. Charitable institutes may any educational, religious or social development institutions. Types of consumer under this category will be as follows, Masjid, Temple, Church, Pagoda, School, College, Madrasah, Club, Orphanage, Charitable institution (Not complex), Charitable dispensary, Crippled rehabilitation center etc.

### **5.2.4 Irrigation**

Consumers drawing power up to 20 kW for irrigation pumping units are categorized as agricultural consumers. Such consumers are given a three phase supply. The loads of the tube wells used for irrigation constitute a substantial portion of the system load. The demand factor and diversity factor are both almost unity.

### **5.2.5 General Power**

Industrial consumers may further be categorized as small industrial consumers, medium industrial consumers and large industrial consumers according to the rating of loads.

Generally Palli Bidyut Samity will implement secondary metering (L.T. metering) for such types of consumer where supply voltage will be 230/400 V and power will be 50KW. Types of consumer under this category will be as follows:

All types of industries and industrial complex, Government office complex, Government and charitable hospital complex, Charitable, religious and education complex, Small Industries related to production or fabrication, Union Paribar Kalian Kendra, Cantonment, air or naval base/installation, Police station, Camp, Outpost etc. and BDR Camp, BOP Installation etc.

### **5.2.6 Large Power**

This category relates to supply of power to industries with a contract demand, where power is substantially utilized as motive force for industrial production. Types of consumer under this category will be as follows:

All types of industries and industrial complex, Government office complex, Government and charitable hospital complex, Charitable, religious and education complex, Small Industries related to production or fabrication, Cantonment, Air or Naval base/installation etc. Police station, BDR Camp, BOP Installation etc.

### **5.2.7 33KV**

DPDC sources said a 33/11 KV substation was launched. Narayanganj district has become the first place in Bangladesh with a guaranteed electricity supply after the Dhaka Power Distribution Company (DPDC) opened a new substation. This category relates to supply of power to industries with a contract demand above where power is substantially utilized as a motive force. The radial type system is the simplest and the one most commonly used.

### **5.2.8 Street Lights**

Power supply given for the lighting of parks, roads and streets under the municipal committees, municipal boards or panchayats comes under this category. The switching on the lights and their switching off is synchronized with dusk and dawn respectively. Separate distributors are run for street lighting to enable their switching simultaneously.

### 5.3 Description of Table and its Analysis

In making of revenue sheet we use Electricity rate, used electricity in KWh, Consumer class, and revenue in monthly and finally we calculate it in yearly. In analysis part we want to show that rate changing of electricity, Number of consumer and its increment or decrement in monthly, used electricity in KWh and its monthly status and revenue increment or decrement in monthly. From these analysis we will see that the present condition of the revenue of BREB.

**Table 5.1: Monthly Revenue data of NPBS-1**

Fig: 5.1 Monthly Revenue data of NPBS-1

**Fig: 5.2 Monthly Revenue data of NPBS-1**

**Fig: 5.3 Monthly Revenue data of NPBS-1**

**Fig: 5.4 Monthly Revenue data of NPBS-1**

If we look at the month of July 2015 consumed 60205577 Units, Units 22967103 has been used by domestic consumers. Total Number of consumer 134702 and total revenue 114021566 TK where minimum slab was 71655 units, Number of consumer 4160 and revenue 374,400 TK.

In 0-50 total consumed 1710997 units, Number of total consumer 26676 and total revenue 6,522,969 TK. In 0-75 total consumed 2885166 units, Number of total consumer 35982 and total revenue 12,065,142 TK. In 76-200 total consumed 15389680 units, Number of total consumer 57949 and total revenue 78,551,022 TK. In 201-300 total consumed 2066275 units, Number of total consumer 8025 and total revenue 10,924,592 TK. In 301-400 total consumed 577665 units, Number of total consumer 1136 and total revenue 3,159,344 TK. In 401-600 total consumed 164300 units, Number of total consumer 514 and total revenue 1,411,043 TK. In 600 plus total consumed 101365 units, Number of total consumer 260 and total revenue 1,013,054 TK.

In Commercial total consumed 1891631 units, Number of total consumer 5588 and total revenue 18,534,702 TK. In Charitable total consumed 392209 units, Number of total consumer 1586 and total revenue 2,036,285 TK. In Irrigation total consumed 16075 units,

Number of total consumer 109 and total revenue 65,967 TK. In General Power total consumed 2862534 units, Number of total consumer 1550 and total revenue 22,057,030 TK. In Large Power total consumed 13017387 units, Number of total consumer 467 and total revenue 100,609,158 TK. In Street Light total consumed 11361 units, Number of total consumer 48.00 and total revenue 80,091 TK. In 33 KV total consumed 19047277 units, Number of total consumer 36 and total revenue 138,575,973 TK.

Again if we look at the month of June 2016 consumed 80260345 Units, Units 23573039 has been used by domestic consumers. Total Number of consumer 169073 and total revenue 115990026 TK where minimum slab was 119686 units, Number of consumer 7979 and revenue 718,110 TK.

In 0-50 total consumed 1870168 units, Number of total consumer 39126 and total revenue 7,748,159 TK. In 0-75 total consumed 6332281 units, Number of total consumer 46955 and total revenue 25,236,543 TK. In 76-200 total consumed 10957340 units, Number of total consumer 58092 and total revenue 57,773,028 TK. In 201-300 total consumed 3017510 units, Number of total consumer 11813 and total revenue 16,469,179 TK. In 301-400 total consumed 1057600 units, Number of total consumer 3305 and total revenue 6,036,913 TK. In 401-600 total consumed 169650 units, Number of total consumer 1305 and total revenue 1,508,580 TK. In 600plus total consumed 48804 units, Number of total consumer 498 and total revenue 499,514 TK.

In Commercial total consumed 2008622 units, Number of total consumer 6512 and total revenue 20,227,630 TK. In Charitable total consumed 408955 units, Number of total consumer 1776 and total revenue 2,256,972 TK. In Irrigation total consumed 21343 units, Number of total consumer 135 and total revenue 84,768 TK. In General Power total consumed 3733743 units, Number of total consumer 1561 and total revenue 29,373,972 TK. In Large Power total consumed 21207359 units, Number of total consumer 490 and total revenue 163,562,480 TK. In Street Light total consumed 11695 units, Number of total consumer 48 and total revenue 87,761 TK. In 33 KV total consumed 29295589 units, Number of total consumer 36 and total revenue 220,996,109 TK.

**Fig 5.6: Monthly Revenue data of NPBS-1**

If we look at the month of July 2016 consumed 70709578 Units, Units 28495641 has been used by domestic consumers. Total Number of consumer 171591 and total revenue

143662610 TK where minimum slab was 52122 units, Number of consumer 7125 and revenue 641,250 TK.

In 0-50 total consumed 1870769 units, Number of total consumer 39908 and total revenue 7,769,885 TK. In 0-75 total consumed 6752228 units, Number of total consumer 35549 and total revenue 26,547,191 TK. In 76-200 total consumed 11888663 units, Number of total consumer 62270 and total revenue 62,664,478 TK. In 201-300 total consumed 4605930 units, Number of total consumer 16191 and total revenue 25,092,560 TK. In 301-400 total consumed 2719280 units, Number of total consumer 7429 and total revenue 15,495,271 TK. In 401-600 total consumed 531529 units, Number of total consumer 2284 and total revenue 4,681,402 TK. In 600plus total consumed 75120 units, Number of total consumer 835 and total revenue 770,573 TK.

In Commercial total consumed 2290125 units, Number of total consumer 6607 and total revenue 22,992,390 TK. In Charitable total consumed 506107 units, Number of total consumer 1792 and total revenue 2,746,127 TK. In Irrigation total consumed 14555 units, Number of total consumer 55 and total revenue 67,269 TK. In General Power total consumed 3206779 units, Number of total consumer 1555 and total revenue 25,412,065 TK. In Large Power total consumed 14117993 units, Number of total consumer 494 and total revenue 110,146,905 TK. In Street Light total consumed 27436 units, Number of total consumer 63 and total revenue 199,631 TK. In 33 KV total consumed 22050942 units, Number of total consumer 37 and total revenue 168,696,585 TK.

If we look at the month of November 2017 consumed 95614227 Units, Units 23281621 has been used by domestic consumers. Total Number of consumer 207404 and total revenue 115168760 TK where minimum slab was 96736 units, Number of consumer 12991 and revenue 1,169,190 TK.

In 0-50 total consumed 2365265 units, Number of total consumer 50038 and total revenue 9,813,209 TK. In 0-75 total consumed 8817860 units, Number of total consumer 53343 and total revenue 34,841,443 TK. In 76-200 total consumed 7097361 units, Number of total consumer 57763 and total revenue 37,924,511 TK. In 201-300 total consumed 2634389 units, Number of total consumer 21787 and total revenue 14,697,205 TK. In 301-400 total consumed 1217518 units, Number of total consumer 7213 and total revenue 7,060,721 TK. In 401-600 total consumed 755305 units, Number of total consumer 3375 and total revenue 6,669,255 TK. In 600plus total consumed 297187 units, Number of total consumer 894 and total revenue 2,993,226 TK.

In Commercial total consumed 2192576 units, Number of total consumer 8172 and total revenue 22,325,209 TK. In Charitable total consumed 421954 units, Number of total consumer 2079 and total revenue 2,337,693 TK. In Irrigation total consumed 10164 units, Number of total consumer 46 and total revenue 40,989 TK. In General Power total

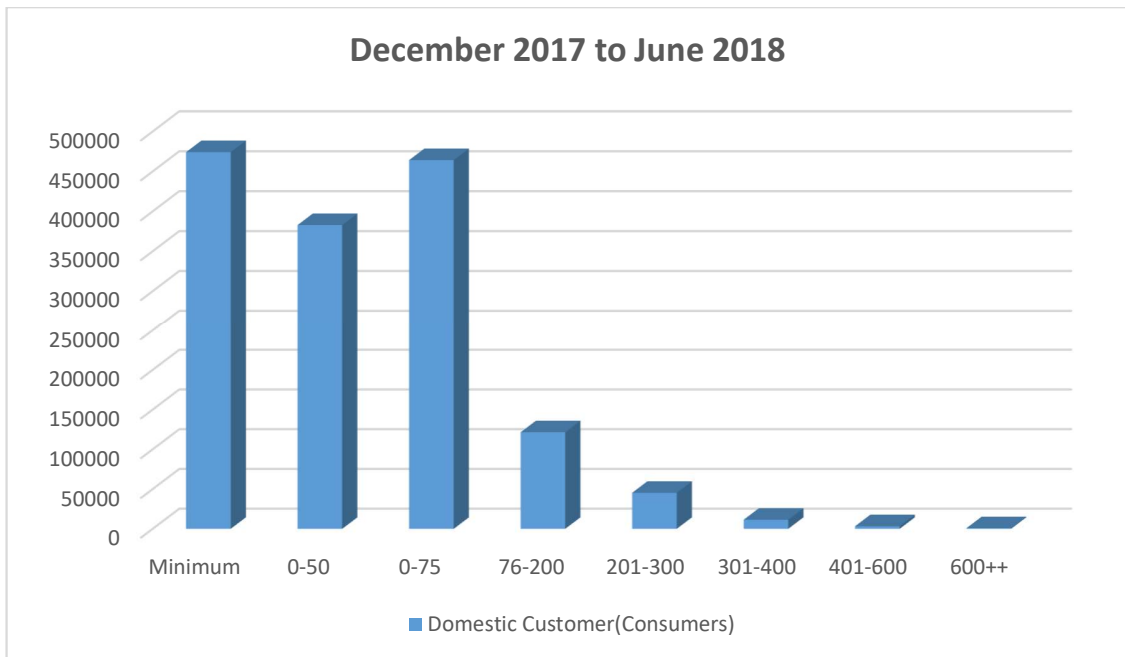

consumed 7144073 units, Number of total consumer 1681 and total revenue 56,400,052 TK. In Large Power total consumed 3562844 units, Number of total consumer 527 and total revenue 30,932,529 TK. In Street Light total consumed 45403 units, Number of total consumer 71 and total revenue 327,494 TK. In 33 KV total consumed 58955592 units, Number of total consumer 41 and total revenue 443,177,470TK.

**Fig 5.9: Monthly Revenue data of NPBS-1**

**Fig 5.10: Monthly Revenue data of NPBS-1**

Data for December 2017 to June 2018 has been shown, the change in customer class and slab has been shown on this table. We look at the month of December 2017 to June 2018

consumed 645843804 Units, Units 148289444 has been used by domestic consumers. Total Number of consumer 1503043 and total revenue 751806969 TK.

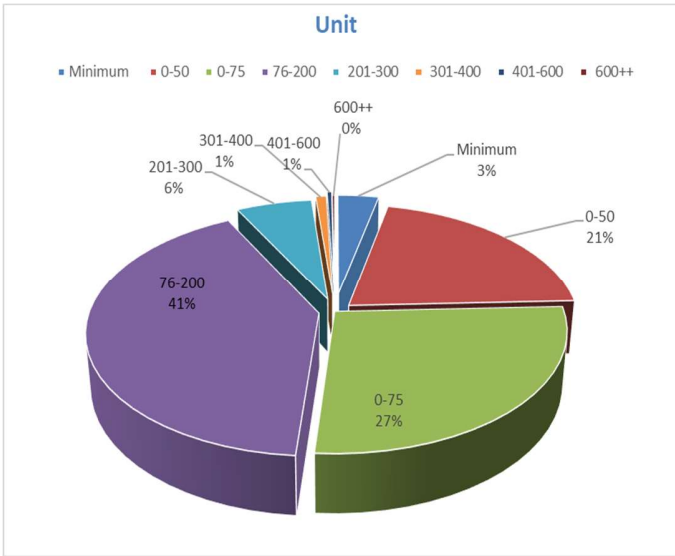

In 0-50 total consumed 22650105 units, Number of total consumer 474192 and total revenue 93,848,180 TK. In 0-75 total consumed 49387273 units, Number of total consumer 382917 and total revenue 207,122,017 TK. In 76-200 total consumed 54072099 units, Number of total consumer 464248 and total revenue 306,299,140 TK. In 201-300 total consumed 13605716 units, Number of total consumer 121525 and total revenue 80,742,606 TK. In 301-400 total consumed 5681209 units, Number of total consumer 45373 and total revenue 35,448,629 TK. In 401-600 total consumed 2155877 units, Number of total consumer 11479 and total revenue 20,350,981 TK. In 600plus total consumed 737165 units, Number of total consumer 3309 and total revenue 7,995,416 TK.

In Commercial total consumed 2192576 units, Number of total consumer 8172 and total revenue 22,325,209 TK. In Charitable total consumed 421954 units, Number of total consumer 2079 and total revenue 2,337,693 TK. In Irrigation total consumed 10164 units, Number of total consumer 46 and total revenue 40,989 TK. In General Power total consumed 7144073 units, Number of total consumer 1681 and total revenue 56,400,052 TK. In Large Power total consumed 3562844 units, Number of total consumer 527 and total revenue 30,932,529 TK. In Street Light total consumed 45403 units, Number of total consumer 71 and total revenue 327,494 TK. In 33 KV total consumed 58955592 units, Number of total consumer 41 and total revenue 443,177,470TK.

## **5.4 Graphical Analysis (Domestic)**

In these processes we calculate all the month of the year of 2015-2016. We divided the year in three season for our capitalize which are,

- ❖ Summer season (March-June).
- ❖ Rainy season (July-October).
- ❖ Winter season (November-February).

**Fig 5.1.1: Domestic Unit and Consumer on August, 2015**

**Fig 5.1.2: Domestic Unit and Consumer on November, 2015**

**Fig 5.1.3: Domestic Unit and Consumer on April, 2016**

The above graph express about number of consumer of domestic slab for different seasons. The Number of consumer varies season to season from upper slab to lower slab and lower slab to upper slab. There eight types of consumer in domestic slab such as, Minimum, 0-50 KWh, 0-75 KWh, 76-200 KWh, 201-300 KWh, 301-400 KWh, 401-600 KWh and 600++ KWh.

In Fig 5.1.1, energy consumption is 21% for 0-50 KWh with 21% consumer, 0-75 KWh consume 27% of energy with 27% consumer which is the highest percentage of consumer of the graph, 76-200 consume 41% of energy with 41% consumer which is the highest percentage of consumer of the graph , 201-300 KWh consume 6% of energy with 6% consumer, 301-400 KWh consume 1% energy with 1% consumer, 401-600 KWh consume 1% energy with 1% consumer, Minimum slab consume 3% with 3% consumer and both 600++ consumer and consume energy are about to 0%. In summer season, consumer increases in higher consumed slabs due to more use of electrical appliance. In Fig 5.1.2, energy consumption is 10% for 0-50 KWh slab with 26% consumer, 0-75 KWh slab consume 26% with 23%, 76-200 KWh consume 42% energy with 36% consumer which is

the highest percentage of consume of the graph, 201-300 KWh consume 13% energy with 6% consumer, 301-400 KWh consume 6% energy with 2% consumer, 401-600 KWh consume 2% energy with 1% consumer, Minimum consumer is 6%; consume 1% energy and both 600++ consumer and energy consume are about to 0 %. In winter season, consumer goes down into lower slabs due to less use of electrical appliance like AC, fan, refrigerator etc. In Fig 5.1.3, the number of consumer is 25% consume 7% energy for 0-50 KWh, 0-75 KWh consumer is 27% consume 27% of energy, 76-200 KWh consume 49% energy with 34% consumer which is the highest percentage of consume of the graph, 201-300 KWh consume 12% energy with 6% consumer, 301-400 KWh consume 3% energy with 1% consumer, 401-600 KWh consume 1% energy with 1% consumer, Minimum consumer is 6 % consume 1% energy and both 600++ consumer and energy consume is still about 0 %.

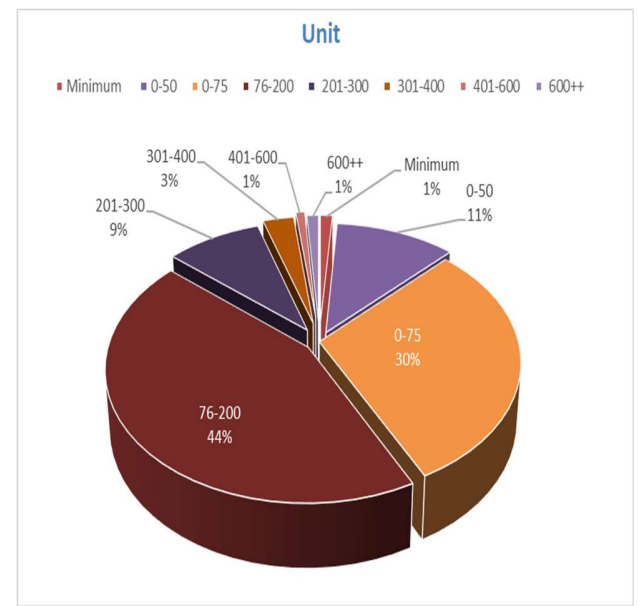

Fig 5.2.1: Domestic Unit and Consumer on August, 2016

**Fig 5.2.2: Domestic Unit and Consumer on November, 2016**

**Fig 5.2.3: Domestic Unit and Consumer on April, 2017**

In Fig 5.2.1, energy consumption is 6% for 0-50 KWh with 17% consumer, 0-75 KWh consume 29% of energy with 28% consumer, 76-200 consume 42% of energy with 35% consumer which is the highest percentage of consume of the graph, 201-300 KWh consume 14% of energy with 10% consumer, 301-400 KWh consume 7% energy with 4% consumer, 401-600 KWh consume 1% energy with 1% consumer, Minimum slab consume 1% with 4% consumer and 600++ consumer 1% and consume energy is 0%. In summer season, consumer increases in higher consumed slabs due to more use of electrical appliance. In Fig 5.2.2, energy consumption is 10% for 0-50 KWh slab with 23% consumer, 0-75 KWh slab consume 21% with 30% consumer, 76-200 consume 47% of energy with 30% consumer which is the highest percentage of consume of the graph, 201-300 KWh consume 13% of energy with 7% consumer, 301-400 KWh consume 7% energy with 3% consumer, 401-600 KWh consume 1% energy with 1% consumer, Minimum consumer is 6%; consume 1% energy and 600++ consumer 0% and energy consume 0%. In winter season, consumer goes down into lower slabs due to less use of electrical appliance like AC, fan, refrigerator etc. In Fig 5.2.3, the number of consumer is 27% consume 11% energy for 0-50 KWh, 0-75 KWh consumer is 26% consume 30% of energy, 76-200 consume 44% of energy with 32% consumer which is the highest percentage of consume of the graph, 201-300 KWh consume 9% of energy with 5% consumer, 301-400 KWh consume 3% energy with 1% consumer, 401-600 KWh consume 1% energy with 1% consumer, Minimum consumer is 8 % with consume 1% energy and 600++ consumer 0% and energy consume is still about 1%.

**Fig 5.3.1: Domestic Unit and Consumer on August, 2017**

**Fig 5.3.2: Domestic Unit and Consumer on November, 2017**

In Fig 5.3.1, energy consumption is 6% for 0-50 KWh with 23% consumer, 0-75 KWh consume 30% of energy with 22% consumer, 76-200 consume of energy 42% and

consumer 33% which is the largest percentage of the graph4, 201-300 KWh consume of energy 14% and consumer 11% , 301-400 KWh consume energy and consumer are 4%, 401-600 KWh consume of energy 3% and consumer 2% , Minimum slab consume 0% with 5% consumer and 600++ consumer 0% and consume energy 1% . In summer season, consumer increases in higher consumed slabs due to more use of electrical appliance. In Fig 5.3.2, energy consumption is 10% for 0-50 KWh slab with 24% consumer, 0-75 KWh slab consume 38% with 26% consumer which is the highest percentage of the unit of the graph, 76-200 consume of energy 31% and consumer 28% , 201-300 KWh consume of energy 11% and consumer 11% , 301-400 KWh consume energy 5% and consumer 3%, 401-600 KWh consume of energy 3% and consumer 2% , Minimum consumer is 6%; consume 1% energy and 600++ consumer 0% and energy consume 1% .

## 5.5 Comparisons of Slabs

In the above table analysis shown that the comparison between Total slab of consumer to Domestic slab and we know Total slab of consumer consist of Domestic slab, Commercial slab. In Table 5.3, compare between the No. of consumer, energy consumption and revenue of Total and Domestic according to Total.

**Table 5.5: Compare Domestic with Total, Minimum and 1-75 KWh Slab with it (15-16)**

Month(15-16)	Total		
	Unit	Revenue	Consumer

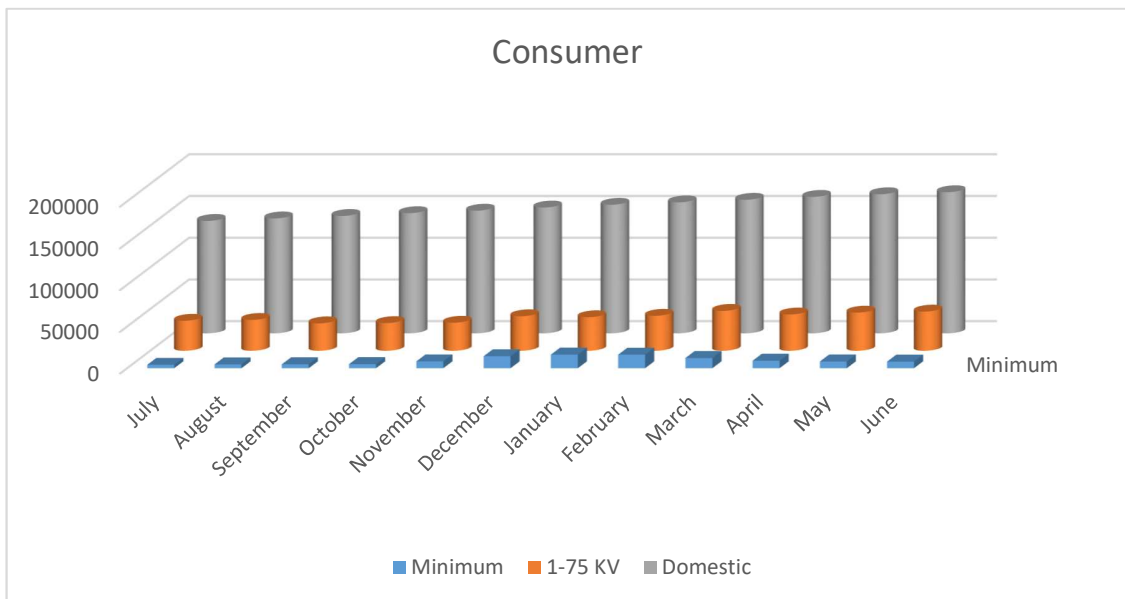

Fig 5.11: Monthly Unit Consumption of other Slabs of Narayananj PBS – 1(15-16)

Fig 5.11: Monthly Unit Consumption of other Slabs of Narayanganj PBS – 1(15-16)

In Fig 5.11, monthly energy consumption of the slabs except Domestic are described. Nothing is abnormal in there. Irrigation slab consume more energy February to April than the other months. Consumption of Charitable Institutions and General Power are regular. Consumption of Commercial and Large Power are increased.

Table: 5.6: Monthly Unit Consumption of other Slabs of Narayanganj PBS – 1 (16-

**Fig 5.13: Monthly Unit Consumption of other Slabs of Narayanganj PBS - 1 (17-18)**

In Fig 5.12, monthly energy consumption of the slabs except Domestic are described. There are six month for 2017 to 2018. Nothing is abnormal in there. Consumption of Charitable

Institutions and General Power are regular. Consumption of Commercial and Large Power are increased.

## 5.6 Comparison of Total, Commercial, Charitable Institution, Irrigation, General Power, Large Power, 33 KV and Street Lights

In Table 5.8, Minimum and 1-75 KWh slabs are comparing with Domestic total. Tariff rate of these slabs are lower than the bulk price. Data indicate with red color are abnormal in values. According to PBS rule, consumer included in slabs by their consume energy. But average energy consumptions (Unit per consumer) of these data are much higher than its slab. If the data are wrongly included in these slabs, then an amount of profit was lost. PBS should avoid this sort of mistake.

In table-5.8, for commercial users are highest unit consumption in April that is 2259181 and lowest unit consumption in December that is 1528355 units. In July, the unit consumption is 1891631 and this is 3.14% of total unit in this month, Revenue is 18534702 taka and this is 4.68% of total revenue in this month, consumer is 5588 and this is 3.88%

of total consumer in this month. In August, the unit consumption is 1905810 and this is 2.73% of total unit in this month, Revenue is 18714518 taka and this is 4.03% of total revenue in this month, consumer is 5623 and this is 3.82% of total consumer in this month. The other users comparisons is same.

In table-5.10, for commercial users are highest unit consumption in July that is 2647845 and lowest unit consumption in November that is 2192576 units. In September, the unit consumption is 2468775 and this is 2.80% of total unit in this month, Revenue is 24844967 taka and this is 4.17% of total revenue in this month, consumer is 7969 and this is 3.70% of total consumer in this month. In October, the unit consumption is 2283409 and this is 2.29% of total unit in this month, Revenue is 23203273 taka and this is 3.37% of total revenue in this month, consumer is 8086 and this is 3.71% of total consumer in this month. The other user's comparisons is same.

## 5.7 Summary

Revenue of NPBS-1 is not sufficient to meet the profit. Wrongly included data in Domestic slabs are increasing the financial loss. Demand of all Domestic slabs is same. If demands vary in higher consuming slabs then revenue would have been increased a little and demand charge would be more effectible for PBS. Overall energy consumption, consumer and revenue are increasing.

# CHAPTER 6

## Electricity Cost and Rate

### 6.1 Electricity Cost

Cost is a key word in a business, where profit or loss is a concern. Power supply is a business. Cost of electricity is how much one spent or pays to generate, distribute or consume electricity. Electricity is the major power source in all over the world. That is why electricity costs are important for improving economic and social benefits.

### 6.2 Electricity Purchase Cost (EPC)

The electricity purchase cost consists of the purchase of electricity costs and bulk price and wheel charge. Bulk pricing is provided to the generation company and the holding charge is paid by the distribution agency. As a distribution wing, NPBS-1 gives bulk price for BPDB or their IPPs to purchase electrical power and wheeling charges for wheeling in PGCB.

#### 6.2.1 Bulk Rate

BPDB sells distribution companies with their bulk rates to generate electricity. According to the BERC situation, this rate has been amended. Distribution companies buy electricity from some private generation companies. But the rate is much lower than the bulk rate.

#### 6.2.2 Wheeling Charge

Wheel charges are paid by PGCB distribution companies. The company's operation has taken up infrastructure development projects for further development. For financial innovation, ensure proper maintenance of its existing assets, the PGCB will now be paid better than what the distribution companies have received. At the bulk supply level, it is clear that major contributor in terms of loss of purchase cost from rental power plants. More detailed research on the quantity of losses and the supply and loss of different bulk

buyers will be needed. A more urgent need to deal with the short-term generation plan so that electricity is available in low-cost grids. A concerted effort was made to establish a competitive sender's regime for generating power through a cooperative pool, to increase competitive skills from medium to long-term, generation private and public sectors. At retail level, cross-subsidaries are raised between different class customers.

### 6.3 Distribution Cost

Expense for distributing the electric energy to consumers is said to be distribution cost. Operation and maintenance cost, Consumer selling expenses, Administration and general expenses, Depreciation and amortization expenses, Tax expenses and interest expenses are included in distribution cost.

**Distribution Cost = Operation & Maintenance Expenses + Consumer selling expenses + Administration & General Expenses + Depreciation & Amortization + Tax Expenses + Interest Expenses**

**Table 6.1: Distribution and Total Supply Cost in 2015-16 of NPBS-1**

### 6.3.1 Operation & Maintenance Expenses (OME)

All types of costs for operation and maintenance are included as OME. Operation supervision and engineering, the cost of operation, cost of operation, cost of overhead line, meter costs, cost of operation and maintenance of consumer installation. In Table 6.1, all data is described in crore taka.

### **6.3.2 Consumer Selling Expenses (CSE)**

A selling expense is a cost incurred to promote and market products to customers. These costs can include anything from advertising campaigns and store displays to delivering goods to customers. Any expense that is associated with selling a good or making a sale is considered a selling expense.

### **6.3.3 Administration and General Expenses (AGE)**

Administrative and general expenses are broken into operation and maintenance costs, cost is being mostly based on operation. Operation costs include administrative and general wages, office supplies and costs, transfer administrative expenses, external services, property insurance, injuries and damage, rent and service fees. The cost of maintenance includes only the maintenance of the common plant.

### **6.3.4 Depreciation & Amortization Expenses (DAE)**

The depreciation expenses included as a cost is the monthly depreciation for all used and useful assets. In a broader economic sense, the depreciation cost is the aggregate amount of capital that is "used up" in a given period, such as a fiscal year. This value can be examined for trends in capital spending and accounting aggressiveness.

### **6.3.5 Tax Expenses (TE)**

All type of tax is included in tax expenses such as expense for revenue stamp, municipal tax, land and development tax etc.

### **6.3.6 Interest Expenses (IE)**

Expenses of payable interests on loans from bank, BREB or from any other loans are included as IE. In 2015-16, NPBS-1 pays 3.523 crore Taka, In 2016-17, NPBS-1 pays 2.279 crore Taka and In 2017-18, NPBS-1 pays 3.078 crore Taka.

In Fig 6.1, DAE was very high in June, 2016. AGE was very high in June, 2016 respect the other months. CSE was also high in June, 2016 from rest of the months. OME increased in the same months where CSE rise.

In Fig 6.2, DAE was very high in September, 2016. AGE was very high in June, 2017 respect the other months. CSE rise in March, 2017 from rest of the months. OME increased in the same months where CSE rise.

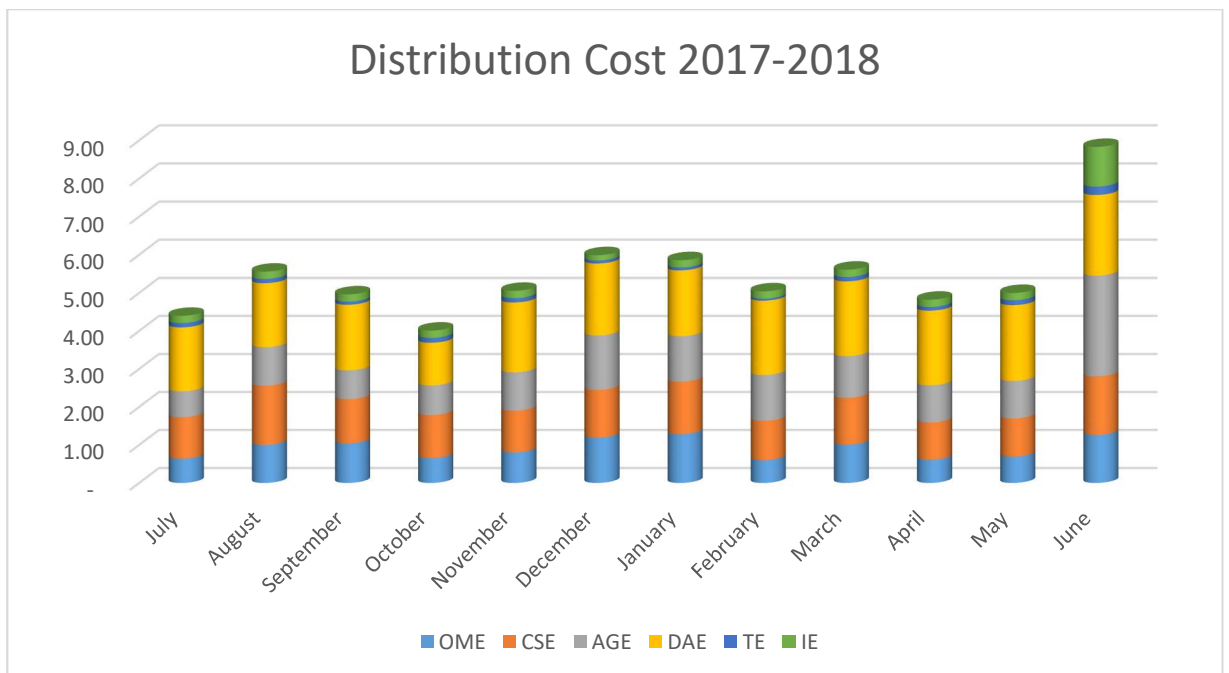

In Fig 6.3, DAE was very high in June, 2018. AGE increased in the same months where DAE rise. CSE rise in June, 2018 from rest of the months. OME rise in, January 2018 from rest of the months.

**Fig 6.1: Distribution Cost (In 10<sup>7</sup> Taka) of NPBS-1 in 2015-16**

**Fig 6.2: Distribution Cost (In 10<sup>7</sup> Taka) of NPBS-1 in 2016-17**

**Fig 6.3: Distribution Cost (In 10<sup>7</sup> Taka) of NPBS-1 in 2017-18**

### 6.3.7 System Loss (Tk.)

Calculate system loss KWh in taka. System loss in taka is help to calculate the distribution cost more correctly and showed an economical figure of system loss. NPBS had a system

loss of total 1.77723 crore taka in 2015-16, 2.29180 crore taka in 2016-17 and 1.93221 crore taka in 2017-18.

System Loss (Tk.) = System Loss (Energy) \* System loss (Tk./Unit)

## **6.4 Revenue**

The revenue is the amount of income that a PBS should have opportunity to earn in order to maintain operations and attract capital for investment, but still maintains least cost for consumers. Revenue of NPBS is 40 to 75 crore taka per month in 2015-16, 55 to 70 crore taka per month in 2016-17 and 70 to 80 crore taka per month in 2017-18.

### **6.4.1 Total Revenue (TR)**

Total revenue is the total earning money of a PBS. A PBS earns its revenue from two sources. One is from sales of energy to the consumers and the other is revenue from other operating sources.

**Total revenue = Revenue from sales of energy + Revenue from others.**

In fig 6.4, NPBS-1 earn there highest revenue in June 2016. The lowest revenue in July 2015

In fig 6.5, NPBS-1 earn there highest revenue in March 2016, April 2016, May 2016 and June 2016. The lowest revenue in July 2017.

In fig 6.6, NPBS-1 earn there highest revenue in August 2017, December 2017, March 2018, April 2018 May 2018 and June 2018. The lowest revenue in September 2017 and February 2018.

**Table 6.4: Import energy, Purchase cost, Expenditure, Sell energy, Revenue, Distribution cost of energy according to the Thesis Calculation on NPBS- 1 (2015-16)**

Month	Energy Import (MU)	Energy Purchase Cost (10 <sup>^7</sup> Tk)	Energy Sell (MU)	Distribution cost (10 <sup>^7</sup> Tk)	Total Supply Cost (10 <sup>^7</sup> Tk)	Revenue from Sale Energy (10 <sup>^7</sup> Tk)	Revenue from other sources (10 <sup>^7</sup> Tk)	Total Revenue (10 <sup>^7</sup> Tk)	System Loss%	Surplus (+/-) (10 <sup>^7</sup> Tk)	System Loss (10 <sup>^7</sup> Tk)	System Loss (Tk/Unit)	Distribution Cost (Tk/Unit)	Total Revenue (Tk/Unit)

**Fig 6.6: Revenue per month(in%),2017-18**

### 6.4.1.1 Revenue from Sales Energy

Revenue from Consumers only for sale from Energy This section. This amount is collected through the electricity bill from consumers. Demand charges, Corresponding energy rates and some other charges are included in this revenue.

### 6.4.1.2 Revenue from Others

Revenue from others is actually summation of operating revenue from other sources, non-operating margins- interest and non-operating margins-Others.

**Revenue from others = Other Operating Revenue + Non-operating Margins- Interest + Non-operating Margins-Others**

Fig 6.7: Monthly Total Revenue of NPBS-1 (10<sup>7</sup> Tk) (2015-16)

Fig 6.8: Monthly Total Revenue of NPBS-1 (10<sup>7</sup> Tk) (2016-17)

Fig 6.9: Monthly Total Revenue of NPBS-1 (10<sup>7</sup> Tk) (2017-18)

### 6.4.1.3 Other Operating Revenue

Late payment charge, miscellaneous service revenue, rent for electric property and other electric revenue are calculated as other operating revenue.

#### 6.4.1.4 Non-operating Margins- Interest

Interest from bank deposit, interest from employee loans (Home loan) related with this part. PBS calculates this as revenue and employee have to pay about 10% interest on their home loan.

### 4.5 Total Supply Cost (TC)

From purchase to supply electric energy to the consumers, total cost is said to be the Total Supply Cost. This is the total operational expenses of a PBS. In 2015-16 fiscal years, NPBS showed about 575.851 crore taka as their total supply cost where energy purchase cost was 506.606 crore taka. In 2016-17 fiscal years, NPBS showed about 574.357 crore taka as their total supply cost where energy purchase cost was 505.472 crore taka. In 2017-18 fiscal years, NPBS showed about 639.259 crore taka as their total supply cost where energy purchase cost was 572.193 crore taka.

Total supply cost (TC) = Energy Purchase Cost+ System Loss (in Tk.) + Distribution cost (DC)

Fig 6.10: Monthly Total Supply Cost of NPBS-1 (2015-16)

**Fig 6.11: Monthly Total Supply Cost of NPBS-1 (2016-17)**

**Fig 6.12: Monthly Total Supply Cost of NPBS-1 (2017-18)**

## 6.6 Surplus

Surplus defines the profit or loss of a PBS. It's also known as operating margin.

Surplus = Total Revenue- Total Supply Cost

As we see in Fig 6.13 surplus of Narayanganj PBS is in negative position due to high distribution expenses and system loss. In Fig 6.13 Supply cost was abnormally high in June from total revenue. So it is negative value.

**Fig 6.13: Monthly Revenue with Supply cost of NPBS-1 (2015-16)**

**Fig 6.14: Monthly Revenue with Supply cost of NPBS-1 (2016-17)**

**Fig 6.15: Monthly Revenue with Supply cost of NPBS-1 (2017-18)**

## 6.7 Per Unit Cost Calculation

Per unit cost calculated to find cost or revenue of one unit energy that's why we assume profit and loss in short. Here we listed some per unit calculation for NPBS-1.

### 6.7.1 Distribution Cost (Tk/Unit)

In July, 2015-16 NPBS-1 had 575.851 crore taka Total Supply Cost, 506.606 crore taka Energy Purchase Cost and Energy sell is 1198.084 MU. So the Distribution cost (Tk/Unit) of July, 2015-16

$$\begin{aligned}\text{Distribution Cost (Tk/Unit)} &= ( (\text{Total Supply Cost} - \text{Energy Purchase Cost}) / \text{Energy Sell} ) * 10 \\ &= ( (575.851 - 506.606) / 1198.084 ) * 10 \\ &= 0.578 \text{ Tk / Unit}\end{aligned}$$

### 6.7.2 Revenue (Tk/Unit)

In July, 2015 NPBS-1 had 41.4876 crore taka Total Revenue and import 67.42 MU energy. So Revenue on July, 2015 was,

$$\begin{aligned}\text{Revenue (Tk/Unit)} &= ( \text{Total Revenue} / \text{Energy Import} ) * 10 \\ &= ( 41.4876 / 67.42 ) * 10 \\ &= 6.154 \text{ Tk / Unit}\end{aligned}$$

### 6.7.3 System Loss Tk/Unit (SL)

System loss (Tk/Unit) is calculated the price of each unit in system loss.

In July, 2015 NPBS-1 had purchased 67.42 MU with 27.3841 crore taka and Energy sell is 61.80 MU. So the system loss (Tk/Unit) of July, 2015 is

$$\begin{aligned}\text{System loss (Tk/Unit)} &= ((\text{Purchase cost/Sell Energy}) - (\text{Purchase cost/Import Energy})) * 10 \\ &= \left( \frac{27.3841 \text{ crore}}{61.80 \text{ MKwh}} - \frac{27.3841 \text{ crore}}{67.42 \text{ MKwh}} \right) * 10\end{aligned}$$

= 0.369 Tk / Unit

**Fig 6.16: Month wise System loss (Tk/Unit), 2015-16 of NPBS-1**

**Fig 6.17: Month wise System loss (Tk/Unit), 2016-17 of NPBS-1**

**Fig 6.18: Month wise System loss (Tk/Unit), 2017-18 of NPBS-1**

## 6.8 Tariff Rate

This is for information of all concerned that in accordance with the BERC Order Dated: 27 August 2015, the new tariff rates with respect to retail sales of electricity of Bangladesh Rural Electrification (BREB) has been made effective bill from month September 2015 shown in Table 6.7. In this table, it's also shown rate and slabs change since December, 2009.

**Table 6.7: Tariff Rates Since 2009 to 2018**

Consumer class	Slab	Before Dec, 11	01 Feb, 12	01 Mar, 12	Slab	01 Sep, 12	Slab	01 Mar, 14	01 Sep, 15	Slab	01 Oct, 15

## 6.9 Bill Explanation

### ➤ What all utility bills should contain?

Bills—for electricity—should always be dated and contain the following information (Usually on the first page of the bill) –

- Your Name and Address.
- Your customer account or reference number (Always quote this when you contact your supplier).
- The name of your supplier and its contact details.
- How much you need to pay (Including any money owed from previous bills) and when you need to pay by.

➤ **More Detailed Information -**

The following more detailed information about the amount of energy you've used is often found on a separate page of the bill–

- Billing Period – The period in which you used the energy you're being charged for.
- Meter Readings– Difference between the previous and latest reading is the amount of energy (Measured in Kilo watt Hours or KWh) you've used.
- The amount your supplier is charging you for each KWh of electricity. If you pay a standing charge (Which covers things like meter readings and the cost of keeping you connected to the network) you'll pay a single rate; if not then you will pay a higher price for a given number of units and then a lower rate thereafter.
- Meter Number– If your supplier has changed your meter during the billing period you'll see readings for two different meter numbers.

## **6.10 Summary**

In this chapter, electricity rate, revenue and expenses or cost of NPBS-1 are calculated according to the thesis formula. System loss calculated in taka. System loss, Distribution cost and Total Revenue calculated month wise in per unit. NPBS-1 find in massive loss.

# CHAPTER 7

## CONCLUSION

### 7.1 Conclusions

Electricity distribution cost is important issue in our country. Because electricity tariff rate and distribution cost are related with our economic growth. When electricity tariff rate becomes high then poor people of our country suffers a lot. By thinking about them, electricity tariff rate of our country should be low.

Government has given highest priority to power development in Bangladesh and is committed to generating electricity will sufficient for all citizens by 2021. Our government should take step for improvement our power station. In our power station, generators efficiency rate is low. It should be increased to a high value by taking necessary steps.

### 7.2 Limitations

There are few limitations I have faced are mentioned below-

- In this study the data of NPBS-1 I have used, collected from BREB (Bangladesh Rural Electrification Board) and NPBS-1 but I think some of these data are assumption.
- The distribution cost of NPBS-1 I have calculated are almost the same as that given by BERC. The slight difference of cost caused by the data that are assumption.
- In this thesis, I have discussed about electricity distribution structure and calculated the distribution cost but the tariff rate of electric power depends on generating, transmission, distribution cost. To calculate the tariff rate of electric power, transmission and distribution cost needs to be calculated along with the generation and transmission cost.

### **7.3 Future Outline**

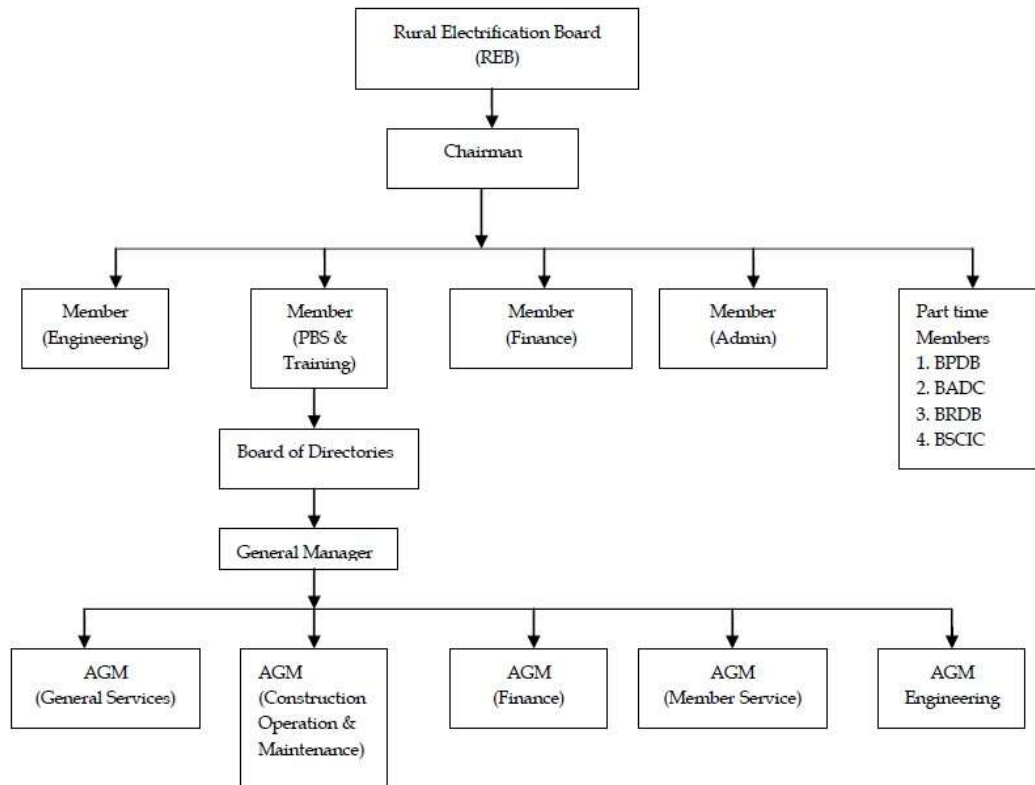

Usually, Tariff rate of electrical power depends on transmission and distribution cost. If electricity supply costs are high then electrical tariff rate will high and committed negative result. In this paper, we discussed about Distribution cost of a PBS, how to calculate, with example. I also discussed about important terms. Interested people can study to calculate the Distribution cost and electricity tariff. This paper will also be helpful to get knowledge a stable electricity distribution structure to meet the future electricity crisis of Bangladesh.

## APPENDIX - A

### Organization and Function of BREB

After starting functioning REB has gone to a lot of changes. But to ensure a proper function a board was created. It consists of a Chairman, four full time members and four part time members. Also to ensure direct participation of the beneficiaries, each project area should form an electric cooperative, called a Palli Bidyut Samity (PBS). These PBSs consist of several members. But PBS is directed by a member of REB. An organization chart of REB is given above.

## APPENDIX - B

Formula According to Thesis

Total revenue = Revenue from sales of energy + Revenue from other sources

Revenue from others = Other Operating Revenue + Non-operating Margins-interest+ Non-operating Margins-Others

Distribution cost = Operation & Maintenance Expenses + Consumer Selling Expenses + Administration & General Expenses + Depreciation & Amortization

+Tax Expenses+ Interest Expenses

Total supply cost = Energy Purchase Cost+ System Loss + Distribution Cost

System Loss (Tk) = Import Energy×System Loss (Tk/Unit)

Surplus (Tk) =Total Revenue –Total Supply Cost

Energy Purchase Cost=Energy×Rate

System loss (Tk/Unit) =  $\left( \frac{\text{Purchase cost}}{\text{Sell Energy}} - \frac{\text{Purchase cost}}{\text{Import Energy}} \right) \times 10$

System Loss % =  $\frac{\text{Energy Import} - \text{Energy Sell}}{\text{Energy Import}} \times 100$

Distribution Cost (Tk/Unit) =  $\frac{\text{Total Supply Cost} - \text{Energy Purchase Cost}}{\text{Energy Sell}} \times 10$

Total Revenue (Tk/Unit) =  $\frac{\text{Revenue from other sources}}{\text{Energy Import}} \times 10$

Load Factor =  $\frac{\text{Total Unit kWh(Purchase)}}{(\text{Total Peak demand} \times 1000 \times 24 \times 30)} \times 100$

KWh (Purchase) % =  $\frac{\text{Reference grid unit KWh}}{\text{Total Unit KWh purchase}} \times 100$

Increment % =  $\frac{\text{Present value} - \text{Past value}}{\text{Past value}} \times 100$

Grand Total = Sum of all related values
