APPROVAL

This Project titled “**Smart Business Information System**”, submitted by Hriday Ahmed, ID No: 142-15-3510 and Mejba Ahmed, ID No: 142-15-4092 to the Department of Computer Science and Engineering, Daffodil International University has been accepted as satisfactory for the partial fulfillment of the requirements for the degree of Bachelor of Science in Computer Science and Engineering and approved as to its style and contents. The presentation has been held on 05/05/2018.

BOARD OF EXAMINERS

Dr. Syed Akhter Hossain

ACKNOWLEDGEMENT

First, we express our heartiest thanks and gratefulness to almighty God for His divine blessing makes us possible to complete the final year project successfully.

We really grateful and wish our profound our indebtedness to **Rubaiya Hafiz, Lecturer**, Department of CSE Daffodil International University, Dhaka. Deep Knowledge & keen interest of our supervisor in the field of “*Business Information System*” to carry out this project. His endless patience ,scholarly guidance ,continual encouragement , constant and energetic supervision, constructive criticism , valuable advice ,reading many inferior draft and correcting them at all stage have made it possible to complete this project.

I would like to say heartiest gratitude to **Dr. Syed Akhter Hossain**, Professor and Head, Department of CSE, for his kind help to finish my final year project and also to other faculty member and the staff of CSE department of Daffodil International University.

We would like to thank our entire course mate in Daffodil International University, who took part in this discuss while completing the course work.

Finally, we must acknowledge with due respect the constant support and patients of our parents.

ABSTRACT

In an industry, the requirements of the system have to be cost effective. There are also some challenges such as to analyze cost and profit on a product, about business requirements, in management, decision making processes in business. When some challenges are holding a manager back that is where Smart Business information system comes. Smart Business information system has a purpose to make the information easier between all business functions within the boundaries of the organization and manage the organizations connections with its outside system analyst. There are two modules in the system which is Transactional module and financial module. And there is also a dashboard which maintains access the power of Admin, manager, director and regular users. In traditional management system there is no specific authentication access to the system. But in this system, there is a specific authenticate access to the system using dashboard. And most of the traditional business management information system there is no inter department coordination. But in this system, there is inter department coordination. A system analyst of specific module of a specific section can only get access to the authorize section. Unauthorized users would not able to get access to a specific section of a specific module.

CHAPTER 1

INTRODUCTION

1.1 Introduction of the Project

In this era of sciences and technology, technology is used to help us in every sphere of life. Smart Business Information System is an integrated system. It may help to store and manage data from every phase of business.

The SBIS system helps to integrate all the different departments and functions of an organization into a single computer system to serve the various needs of that organization. With an integrated solution, different departments can easily share information and communicate with one another. In this business management information System there are two modules which are transactional and financial module.

1.2 Motivation

Our main motivation is to save time and digitalized our business system. It is great work to convert our business system digitalized. The dream is to make ourselves a good web developer.

1.3 Objectives

The main purpose of our project is to make the information easier between all business functions within the boundaries of the organization and manage the organizations connections with its outside system analyst. There are two modules in the system which is Transactional module and financial module. And there is also a dashboard which maintains access the power of Admin, manager, director and system analyst. There is a specific authenticate access to the system using dashboard. In this system, there is inter department coordination. A system analyst of specific module of a specific section can only get access to the authorize section. Unauthorized users would not able to get access to a specific section of a specific module.

1.4 Expected Outcome

The main Outcome of our project

- To save time.
- From anywhere access and work nicely.
- No need to store information others place.
- Every person does their specific job.
- All user chats each other.
- The purpose of the project is to reduce the manual work in a business system.

1.5 Report Layout

In the chapter (1) I have described introduction of my project, motivation, objectives, expected outcome.

In the chapter (2) I have described my system full overview, related work, comparative studies, challenges of my project and scope of my project.

In the chapter (3) I have described about different types of model and diagram like as business process model, use case diagram, requirement collection and analysis, logical data model.

In the chapter (4) I have described about my project front-end design, back-end design, interaction design and ux, implementation requirements, test results and reports.

In the chapter (5) I have described about implementation of database, implementation of front-end design, implementation of interactions, testing implementation.

In the chapter (6) I have described is Conclusion and Future Scope. I discuss Future Scopes of this system.

CHAPTER 2

SYSTEM REVIEW

2.1 Introduction

In this era of sciences and technology, technology is used to help us in every sphere of life. Smart Business Information System is an integrated system. It may help to store and manage data from every phase of business. The SBIS system helps to integrate all the different departments and functions of an organization into a single computer system to serve the various needs of that organization. With an integrated solution, different departments can easily share information and communicate with one another. In this business management information System there are two modules which are transactional and financial module.

2.2 Related Works

Maximum business company mainly store their information offline. But few business company maintain online and hiddenly use their system. Normally a user can't find it. Our system for startup business company.

2.3 Comparative Studies

Most of the case Business company store their information manually. But few group of company finally realize that and digitalized their business system. But they have some limitation. In traditional management system there is no specific authentication access to the system. And most of the traditional business management information system there is no inter department coordination. Our aim was to develop like that web application which is free from those limitations. Finally, we completed our web application.

2.4 Scope of the Problem

In an industry, the requirements of the system have to be cost effective. There are also some challenges such as to analyze cost and profit on a product, about business requirements, in management, decision making processes in business. When some challenges are holding a manager back that is where Smart Business Information System comes.

In this modern era most of the people depend on online. Some people are very busy for their official or any others work. So, it is difficult to follow up all the part of a business in our traditional process. That is where Smart Business Information System comes. SBIS save our time and also it is web based so we can access it every place and everywhere.

2.5 Challenges

It's a big challenge to help company in our society. Most of the case our country business company traditionally manage their business information and transaction. They do not think this application benefits. This application helps a user easily find out customer, product, business transaction and other activities of a business company.

CHAPTER 3

REQUIREMENT SPECIFICATION

3.1 Sequence Diagram

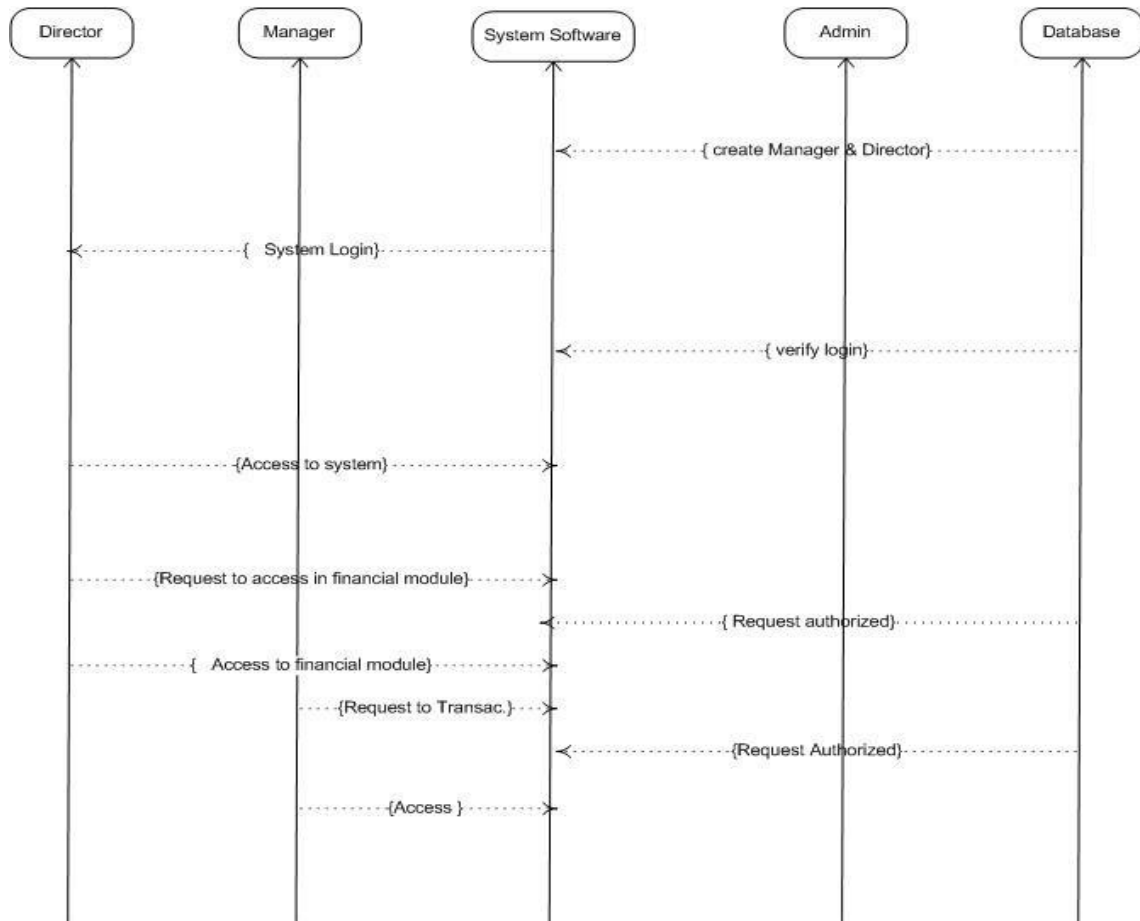

Fig 3.1: Sequence Diagram

3.2 Requirement Collection and Analysis

Firstly, developer create a default admin information. Then admin made other user registration form with access validation. Admin access all the field but manager don't access dataset & financial, director don't access dataset and system analyst only access

dataset option full of the information system. Reminder that every user must be login in first this system. By this way we are collecting data. We have already rightful data.

3.3 Use Case Modeling

CHAPTER 5

IMPLEMENTATION AND TESTING

5.1 Implementation of Database

This project is made for help business company. As build up community, here all the user communicates each other and update their database. To connected people internet is the most fastest media to reach people. So, we marge it together to build a powerful community to help each other. On this purpose we chose web for the best solution. We build our database live and it give the data any cross platform. We use MYSQL Database.

5.2 Implementation of Front-end Design

We build up our web application in HTML, CSS, CSS3 and JavaScript. Our UI is most attractive and neat and clean. Our front page is so simple. For this reason, it takes short time to load & give the result so fast as fast as possible. UI is the most important part of a user to use this. Load time of page is most important also, cause if a user need 1 minute or 2 minutes to load a web page most of the time user ignore those type of web app. So, for this reason we build it so simple.

5.3 Implementation of Interactions

We said that our project build for create a big community to help each other. Without user help it's a useless project. We try to best to close to user and give them the best experience to our application. We ensure that we protect their information and don't give any public uses for bad purpose. Why a user uses our application, cause it a clean UI, faster load time, easily contact to the right person. We also connected to our user with biggest business platform. We create an option to receive user feedback using email. It's long project and it was update day by day. Not only as a developer can do this, every project will be successful to help each other. So be a user they will be an important part of our project.

CHAPTER 6

CONCLUSION AND FUTURE SCOPE

6.1 Discussion and Conclusion

Smart Business Information System is a vital information system in the field of technology and business. It has a purpose to make the information easier between all business functions within the boundaries of the organization and manage the organizations connections with its outside system. The transactional and financial module is integrated with dashboard in this system.

6.2 Scope for Further Developments

Future plans are -

To include remaining business processes those are:

- Human Resources and
- Quality Management
