MAY 2018

APPROVAL

This Project titled “CV ZONE”, submitted by **Hora krisna Roy, Maloy Kumar Bhattacharjee and Ashikur Rahman** to the Department of Computer Science and Engineering, Daffodil International University, has been accepted as satisfactory for the partial fulfillment of the requirements for the degree of B.Sc. in Computer Science and Engineering and approved as to its style and contents. The presentation has been held on Sunday 8 April 2018.

BOARD OF EXAMINERS

Dr. Syed Akhter Hossain
Professor and Head

Department of Computer Science and Engineering
Faculty of Science & Information Technology
Daffodil International University

Chairman

Dr. Sheak Rashed Haider Noori

Associate Professor and Associate Head

Department of Computer Science and Engineering
Faculty of Science & Information Technology
Daffodil International University

Internal Examiner

Md. Zahid Hasan

Assistant Professor

Department of Computer Science and Engineering
Faculty of Science & Information Technology
Daffodil International University

Internal Examiner

Dr. Mohammad Shorif Uddin

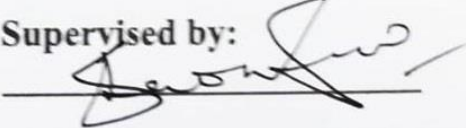

Professor

Department of Computer Science and Engineering
Jahangirnagar University

External Examiner

DECLARATION

We hereby declare that, this project has been done by us under the supervision of **Shaon Bhatta Shuvo, Lecturer, Department of CSE** Daffodil International University. We also declare that neither this project nor any part of this project has been submitted elsewhere for award of any degree or diploma.

Supervised by: 

Shaon Bhatta Shuvo
Lecturer
Department of CSE
Daffodil International University

Co-Supervised by:

Anup Majumder
Lecturer

ACKNOWLEDGEMENT

First we want to thank God for giving us the much needed patience in order to complete our project.

We want to thank our beloved parents for believing us. For their support it would be impossible for us to complete this project.

We also express gratitude to our supervisor sir Mr. Shaon Bhatta Shuvo, Lecturer, Department of CSE, Daffodil International University. Without his direction, Support, Precious Ideas it would be very hard to us complete this project. He remain very helpful and kindly to us through the entire period of making the project.

We also want to thank our most honorable teacher Dr. Syed Akhter Hossain, Professor and Head, Department of CSE. We are very lucky for doing this project under the guidance of him.

We would like to thank our classmate in our class who help us whenever we got some problem in our project.

ABSTRACT

This project is based on web application. The name of our project is “CV ZONE”. This project is made especially for job seekers and job providers. By this application job providers can easily find skill employee in his/her company and also job seekers can easily get a suitable job. A job seekers can get an idea about required skills for his future working field from this website by seeing others profiles. Job providers can choose employee for their company can contact with them for interview. Here admin is the main controller in this website. He/ She can remove a user. There is an option of changing theme color in our web application. User can change the theme if he want. Our project is very user friendly. User can easily use it and get benefitted.

CHAPTER 1

Introduction

1.1 Introduction

Now a day's bookish knowledge is not enough to get a good job. One's have to be good skilled in his area. Without depth knowledge in the area of education it is much more difficult to achieve a better success. So to get a practical and deep knowledge about our field, we have undertaken "CV ZONE" project.

This project is slightly different from other job related sites. Here job seeker can upload his/her CV as if job providers can view job seekers CV whenever he/she needed.

1.2 Motivation

Today in the era of technology every things can find on internet. Recent time's peoples are not read those traditional weakly job related newspapers. There are so many job related websites find on internet. Peoples have not so much patience to browse this type of websites for so long. So we thought to make a simple web application where job seekers and job providers can easily interact with each other's. We wanted to create a platform where IT jobseekers can find a good job at free of cost.

1.3 Objectives of the web application

We worked with a specific area. Here's some of our objectives of the web application are given below.

- Users can upload his/her CV.
- Job providers can see job seekers profiles.
- Job providers can download users CV, if he want.
- Job providers can directly contact with job seekers.

1.4 Expected Outcome

- Our project especially created for jobseekers and job providers. Easy way to find jobs and offer jobs.
- Professional Networking Community.
- Jobseeker will be able to communicate directly with the employee and jobs provider through online
- User will be able to see the jobseeker's profile without calling them for interview.
- Jobseekers will be able to add their CV update their profile, previous working Experience skills and many other information for finding appropriate jobs.
- Jobseeker will be able to comment on job provider profile they will also write blog in this system.

1.5 Report Layout

Report layout is very important to writing a project report. We've maintain a standard layout to writing our project report.

In the chapter one we try to give a good idea about our project. We've discussed about what can user expected from our project.

In the chapter two we discussed about the relative works to our project. We've discussed about the challenges and about the elements that's make our project different than others.

In chapter three we've discussed about bpm, use case and logical databases as well as requirements for the project.

We've tried to give a nice preview of our project in chapter four.

We've discussed the testing part in chapter five and in chapter six gives a total overview of our project and the future development.

CHAPTER 2

Background

2.1 Introduction

Our system will be a web application which can be access from any browser. In our application users have to be signup by his/her email. Users who have done registration can upload his/her own information then system will automatic make a CV by using those information. Job provider can easily get a copy of CV in pdf form by clicking a button called download. If the user want, he can edit, delete his CV at any time.

2.2 Related Works

Before start the project we've seen some related websites to this area. Chakri.com is among of them. Here user can search their job by company, location, and experience.

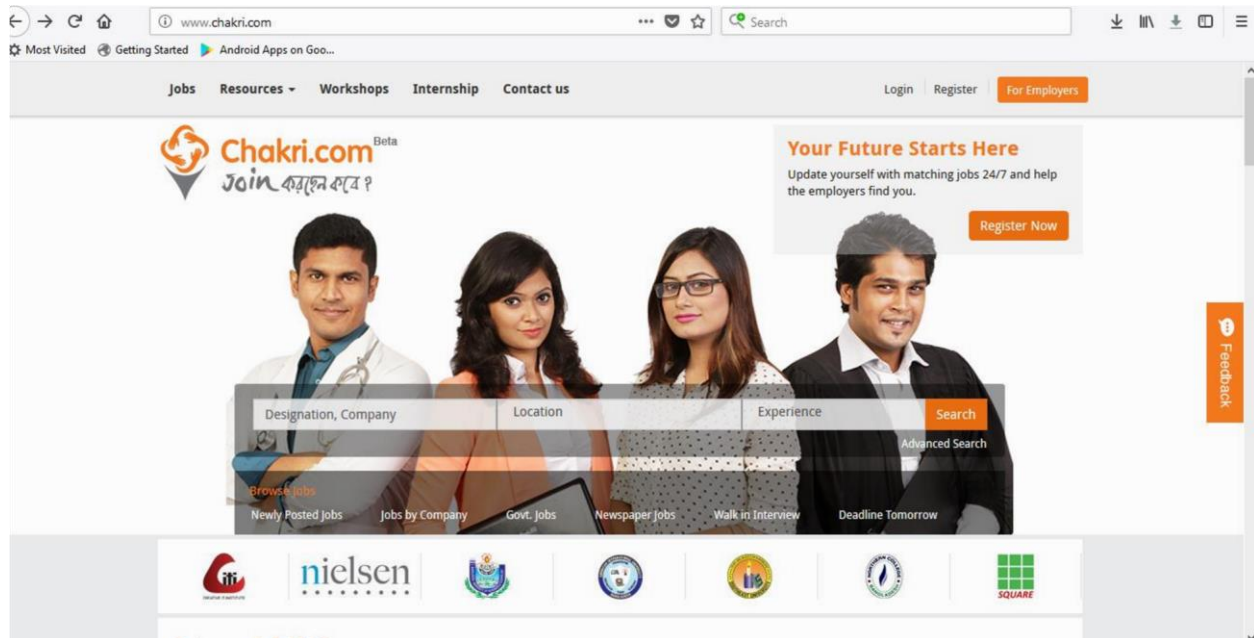

Figure 2.2: Chakri.com

2.3 Comparative Studies

This web application differ from all others web application. Our application stores the full information of job seekers. Job providers can see all the job seekers information by searching their skills and designation. He can also download the information in pdf format.

2.4 Scope Of The Problem

Every web application have some simple problems. This app also have some scope of problems.

- Job seekers can create account with false skills.
- False job providers can harass job seekers.

2.5 Challenges

The development of web applications has now matched its market demand. Thanks to the curious customer base that visit company websites, apps and the social platforms to discover more about the products, their value for money and for other product and company related details. Userfriendly and swift interfaces are the need of the hour, and this demand will increase with the passing time.

But like every technology, web app development has faced a lot of challenges, and today we have shortlisted some of them. [2]

- Must have to use valid email to register and login.
- This system is a unique email system.
- So, one email can be created only one account.
- UI and UX
- Performance
- Less Scalable
- Security

CHAPTER 3

Requirement Specification

3.1 Requirement Collection and Analysis

When it comes to any type of project, requirement collection plays a key role. Requirements collection is not only important for the project, but it is also important for the project management function. For the project, understanding what the project will eventually deliver is critical for its success. Through requirements, the project management can determine the end deliveries of the project and how the end deliveries should address client's specific requirements. [2] Requirements analysis is critical to the success or failure of a systems or software project. The requirements should be documented, actionable, measurable, testable, traceable, related to identified business needs or opportunities, and defined to a level of detail sufficient for system design. Some requirements are needed in data collection for implementing the web application. Here are some of them written below.

- Valid email is needed for registration.
- Valid user name and password is needed to login.
- Needed valid email to send message.
- Needed active phone number.
- Needed passport size recent photograph.
- Photo size must be under 1mb.

3.2 Use case modeling And Description

We create a use case model for whole system. Use case describes scenario's that will be perceived different character. In our project there are two types of character who execute their performance according to their sections. They are

- Administrator
- user

3.2.1 Use case diagram

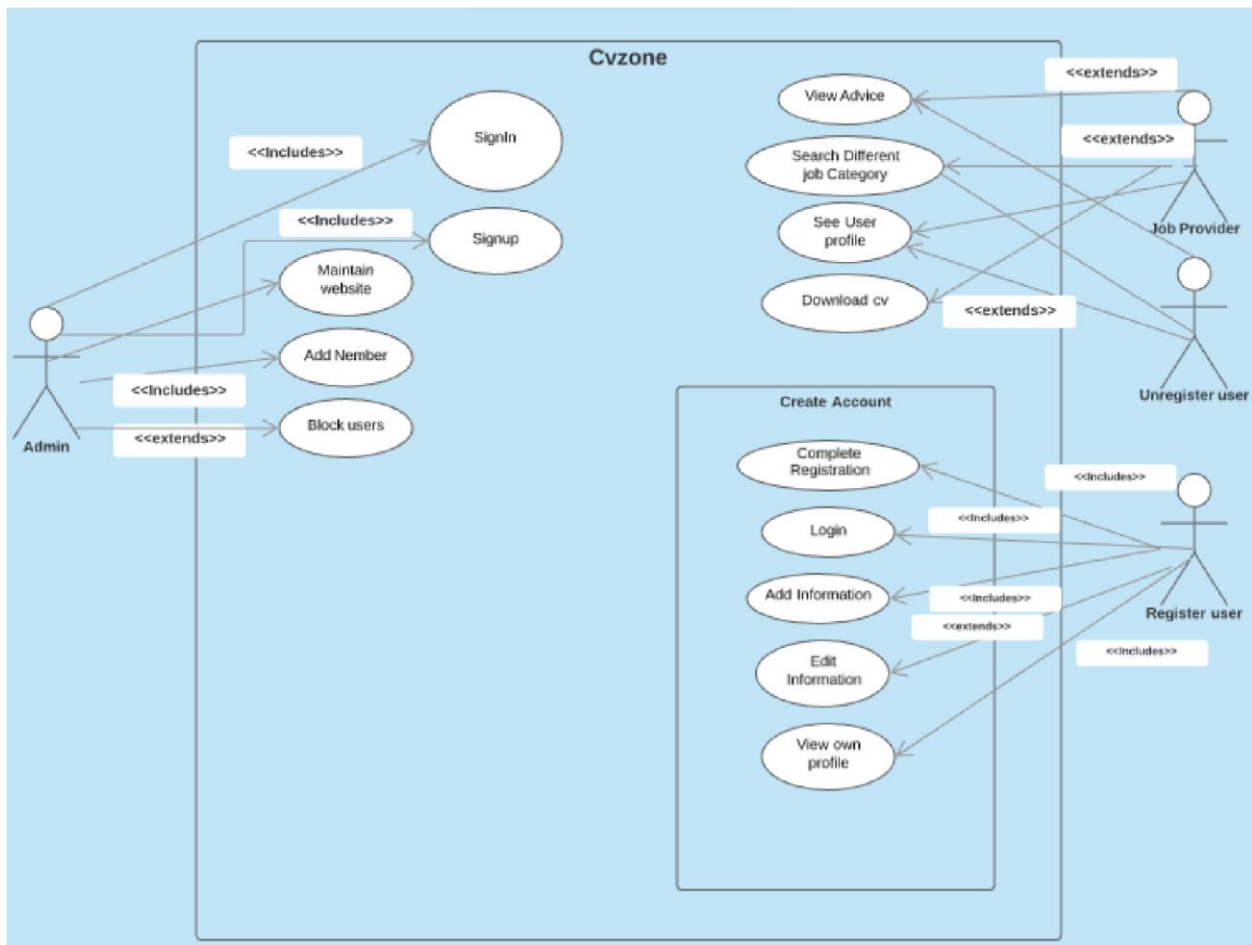

Figure 3.2.1: Use case diagram

3.2.2 Detailed Use Case

Table 3.2.2.1: Use case description of signup.

Name of the use case	Signup
Primary Actor	user
Secondary Actor	system
Pre-condition	Go to the application
Scenario	<ol style="list-style-type: none">1. Enter valid email.2. Enter password.3. Enter other information.4. Enter phone number.5. 5. Click “signup” button.
Post condition	Sign up complete or failed.

Table 3.2.2.2: Use case description of login.

Name of the use case	Login
Primary Actor	User
Secondary Actor	System
Pre-condition	Complete signup.
Scenario	<ol style="list-style-type: none">1. Enter valid email.2. Enter correct password.3. Click “login” button.
Post condition	Show the dashboard or failed.

3.3 Logical Data Model

A logical data model is a data model of a specific problem domain expressed independently of a particular database management product but in terms of data structures such as relational tables and columns, object-oriented classes.[1]

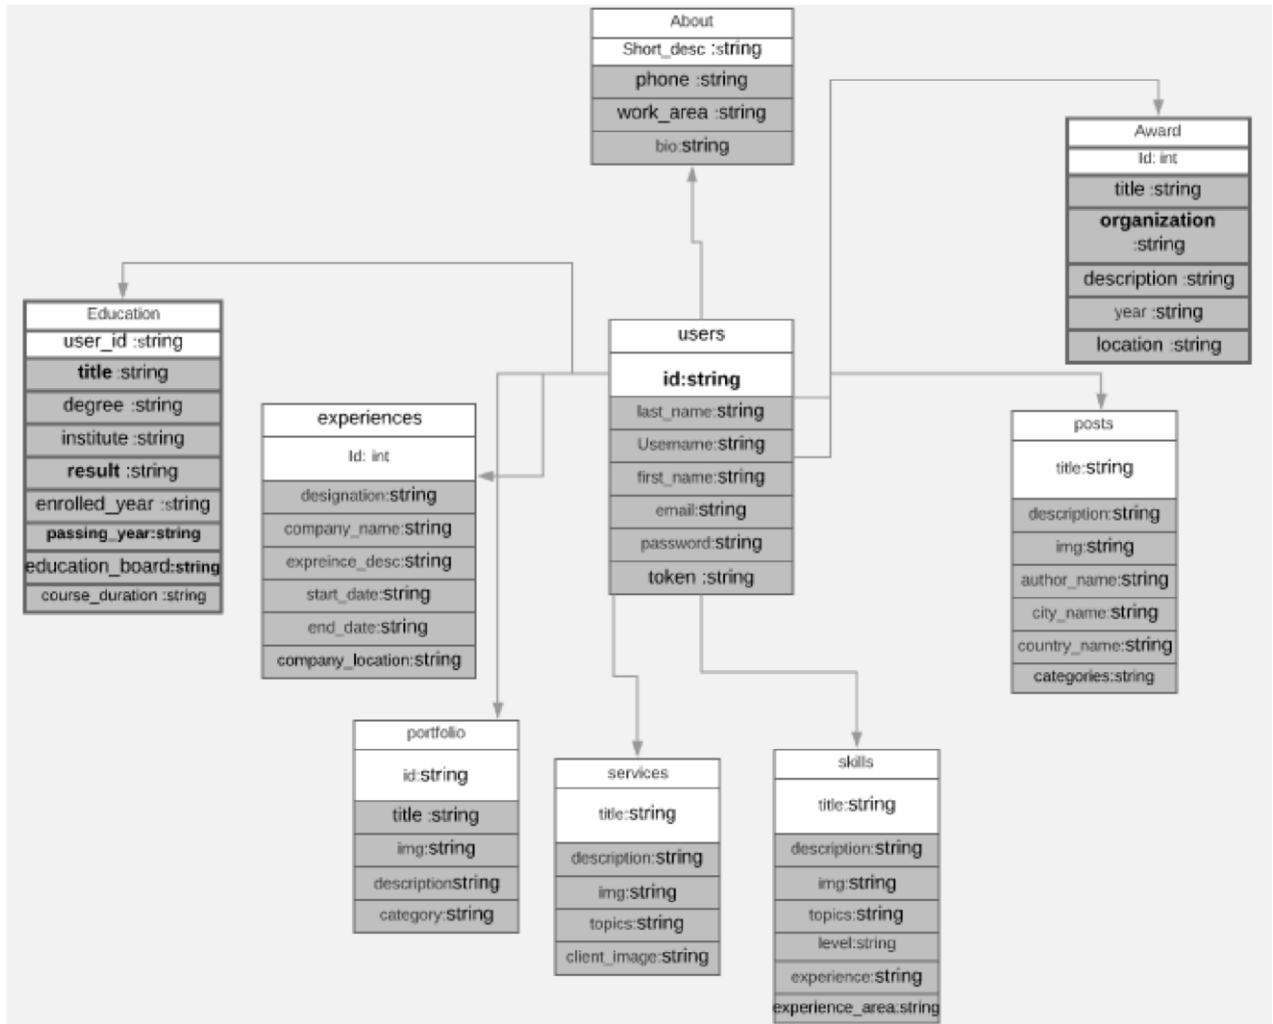

Figure3.3.1: Logical Data Model

3.4 Design Requirements

Many materials are used to making in our project. Here some of materials given below –

- HTML:

Hypertext Markup Language (HTML) is the standard markup language for creating web pages and web applications. With Cascading Style Sheets (CSS) and JavaScript [2].

We used html to design font-end.

- CSS:

CSS called cascading style sheet. We used css 3 to design our project.

- Bootstrap:

We made this website responsive using bootstrap.

- Java Script:

We used java script to make our site more attractive.

- Pixie:

It is used to get color codes.

- Photoshop:

It is used to make logo, banner and get exact measurement to design this project.

CHAPTER 4

Design Specification

4.1 Front-End Design

This is the most significant part of any web application. Because this part is directly interacts with users. That's why we give more importance to beautifully design our system. We tried to make this project as much user friendly as we can.

4.1.1 Home Page

- Anyone can search by using keywords such as skills and designation.
- For advance search user can use categories option.

[Sign up](#)

□ This page is show all the information of registered users.

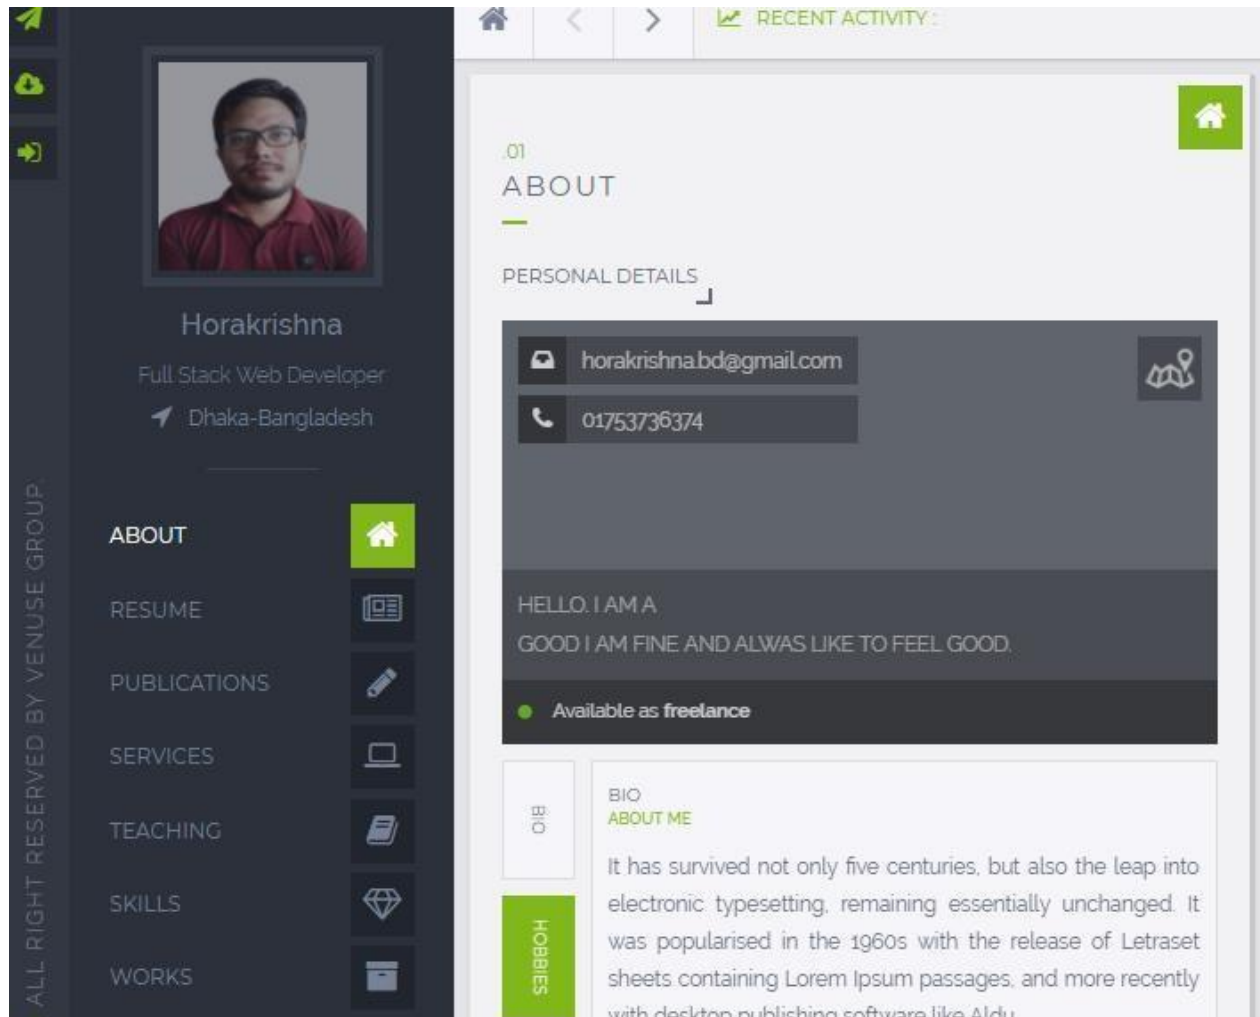

Figure 4.1.4: About page

4.1.5 Resume Page

- This page is show educational qualification of job seekers.
- Academic and professional posting also shown in this page.

The screenshot shows a resume page for a user named Horakrishna, a Full Stack Web Developer based in Dhaka, Bangladesh. The page is divided into several sections:

- Profile:** Includes a profile picture, name (Horakrishna), title (Full Stack Web Developer), and location (Dhaka-Bangladesh).
- Navigation:** A sidebar on the left contains menu items: ABOUT, RESUME (highlighted), PUBLICATIONS, SERVICES, TEACHING, SKILLS, and WORKS.
- RESUME SECTION:**
 - EDUCATION:**
 - Computer science and engineering- Bsc** (Asian University Of Bangladesh, BANGLADESH): Result: 3.83 Board: Durations: 4 (2015-2017).
 - Electronics Engineering- Diploma** (Barisal Polytechnic, BANGLADESH): Result: 3.83 Board: Technical Durations: 4 (2010-2013).
 - ACADEMIC AND PROFESSIONAL POSITIONS:**
 - Junior web developer** (BDtech, DHAKA): Lorem ipsum dolor sit amet, consectetur adipiscing elit. Curabitur at sapien ligula. Interdum et malesuada fames ac ante ipsum primis in faucibus. Aliquam erat volutpat. (2014-2016).

Figure 4.1.5: Resume page

4.2 Back End Design

It is the most important part in a web application. No web application will work without a good back end design. We designed the back end in this project by using object oriented programming and php.

Admin can block the user whenever he/she want. User can modify, delete, add his information at any time

4.2.1 Database design

Here users can update his/her information. Admin can maintain this web application.

Update_at	Datetime	
Delete_at	Datetime	

4.3 Interaction Design and UX

Interaction design, often abbreviated as **IxD**, is "the practice of designing interactive digital products, environments, systems, and services. “Beyond the digital aspect, interaction design is also useful when creating physical (non-digital) products, exploring how a user might interact with it. Common topics of interaction design include design, human–computer interaction, and software development.[3] we’ve tried to keep our app’s interface as simple as we can. So user can easily interact with this application.

4.4 Implementation Requirements

Our web application run with the help of apache web server and MySQL server database system and PHP. In recent times this is the most used and popular web server environment in the world. Our web application have some advance functionality, so we have needed some configuration requirements.

- Needed to install apache web server.
- Needed to install MySQL server.
- Apache with configured PHP must be needed.
- Google API.

CHAPTER 5

Implementation and Testing

5.1 Implementation of Database

Database is called an organized collection of data. It's an online storage where any kind of data can be store. It's very important for a website to have a database. Because storing data in hardware is not so much secure. So it's been always major part for a project to implement a database. Web developer uses this data in various sector of project. Now a day's people are generally want to store all their information on digital platform so that they can get access to it anytime and from anywhere. But it's a very sensitive thing that user's information is very valuable for user. As usual user will not want that somehow his/her information being misused and leaked.

So it's very urgent and important task for any developer to secure the database. The more secure database is the more attractive and useful for user. And that's the reason we've tried our best to secure our database. Only an authorized user can modified his own data. We've use their mail verification technique for verified user.

5.2 Implementation of Front-End Design

Front-end web development is the practice of producing HTML, CSS and usually JavaScript (while Web Assembly is a recent alternative to it) for a website or Web Application so that a user can see and interact with them directly. The challenge associated with front-end development is that the tools and techniques used to create the front end of a website change constantly and so the developer needs to constantly be aware of how the field is developing.[4]

It's very important to look a web application beautiful and attractive so we have tried a lot to look our project attractive and user friendly. We have done a lots of research on user friendly template.

So finally we think of a template which is very simple and easy to use.

To implement this template we used HTML5, CSS3, and java script, bootstrap.

5.3 Implementation of Interactions

User interaction is more important thing than making a web application. Because it's the user for whom we created the web application. So it's the main challenge for us to create a user friendly web application. So that we have tried our best to make our project to easy, simple and user friendly. We hope our application will be easy to use for user and effective. As we worked with a selective area, we think user will accept our application with happy face and will be benefitted. We will see how the user response to our project and then in the basis of response we will do lots of research on it and make sure users satisfaction.

5.4 Testing implementation

There are many importance effort need to do a web application better. Among them testing is one of the importance part for web development. Before releasing a web application to user it's the final step. The drawbacks and error of a web application comes in front of developer due to testing process. After the testing developer can think of next step. So testing is very important in the field of web engineering.

In our web project we have done a lots of testing, some of them discuss in below here- ✓

Error testing:

We had tested lots of input to find whether there was error had or not.

Whenever we found an error, we solved it and made sure that it never could happen again.

We had done this process again and again till we got satisfied.

✓ Data validation:

It's the security testing part. Data validation is very important in web application. Because security is the main aspect of any application. We've test data validation by giving some valid and invalid input data and check the expected result.

✓ Unlimited data store:

Unlimited data can reduce systems speed. It cause unwanted loading. Which makes the application difficult and uncomfortable to use. So we recover the problem and tested the application. We have given many unlimited input and checked the expected outcome.

5.5 Test Results and Reports

Lots of testing are done by us to make the project error free. We have found a thousands of error and tried with our heart and soul to remove all the problems. Finally we got the expected outcome. We do our best to make this project more efficient to the user. We hope that user will not find any problems during using this web application. Our application is easy to use. We hope it will be very helpful to user and we will get lots of response from the user.

CHAPTER 6

Conclusion and Future Scope

6.1 Discussion and Conclusion

We want to build a web application for a selected area as CV making. It is very essential to have a good CV. We've tried our best to make a platform where job provider can directly communicate with job seeker. And for today's situation it's much needed. We made this web app for every sector of people but especially for IT people. We design our database in that way so that it could contain lots of data. We think people will be benefited from this application.

6.2 Scope for Further Development

We've think about the further development of our project. We will improve our search system so that people can feel easier to use the app. We will develop our log in system. We will make it more restricted and protected.
